Programs might look like this:

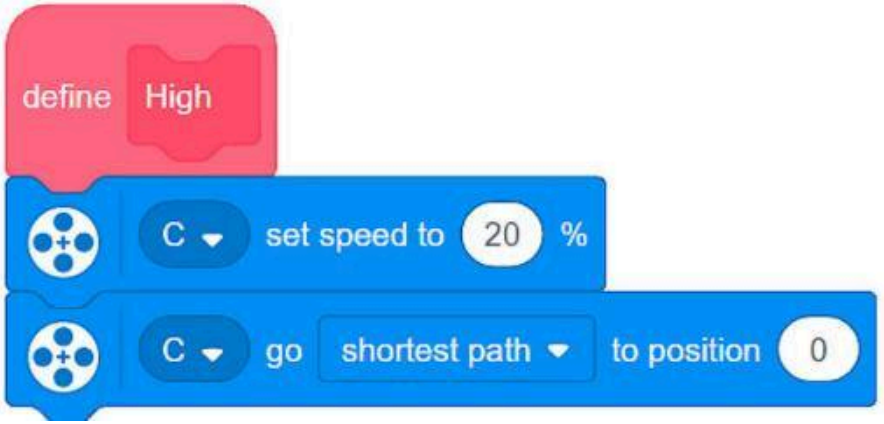

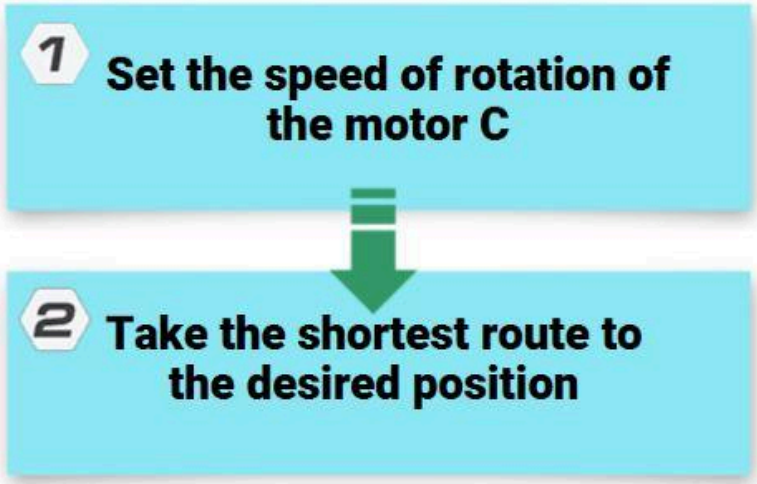

All three programs work according to the same algorithm. The only difference is in setting the motor installation unit to a given position:

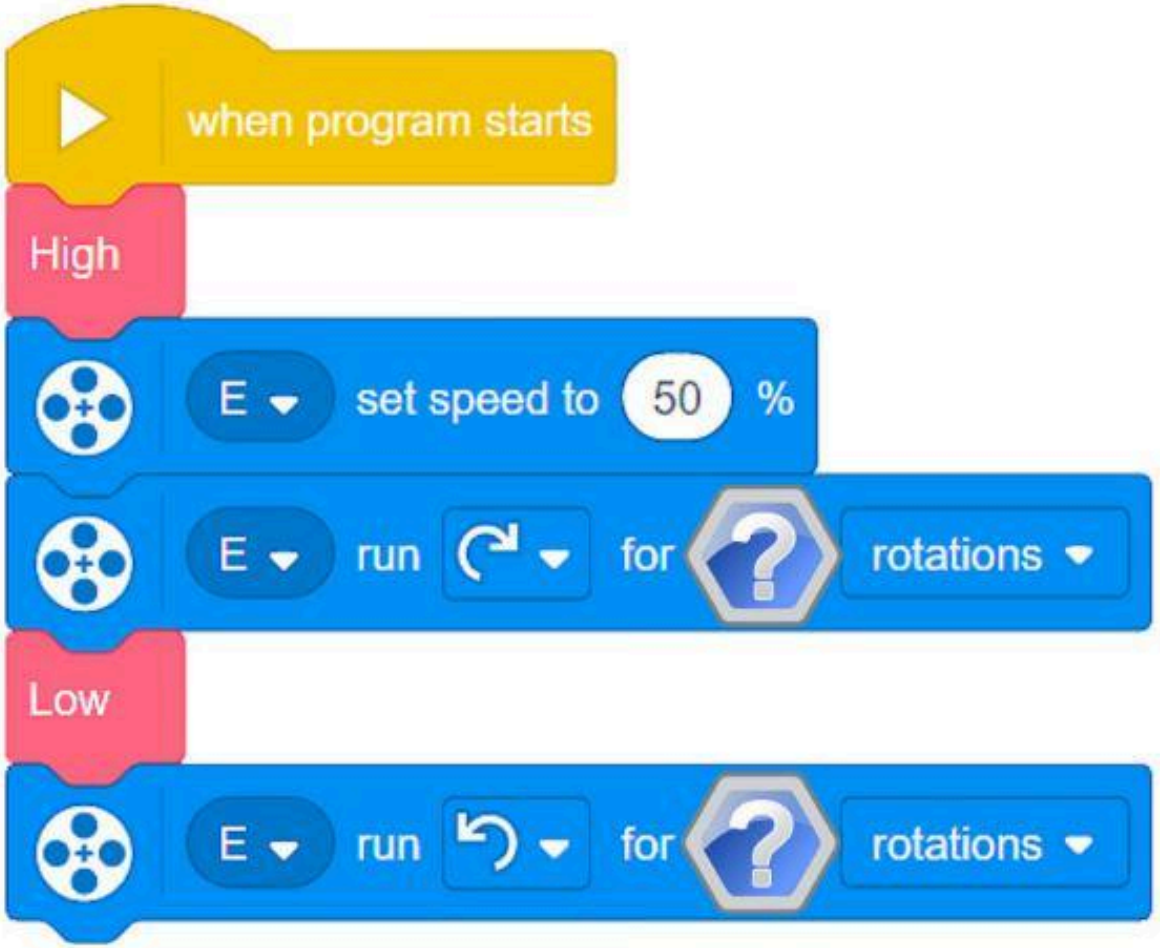

The task execution algorithm can be as follows:

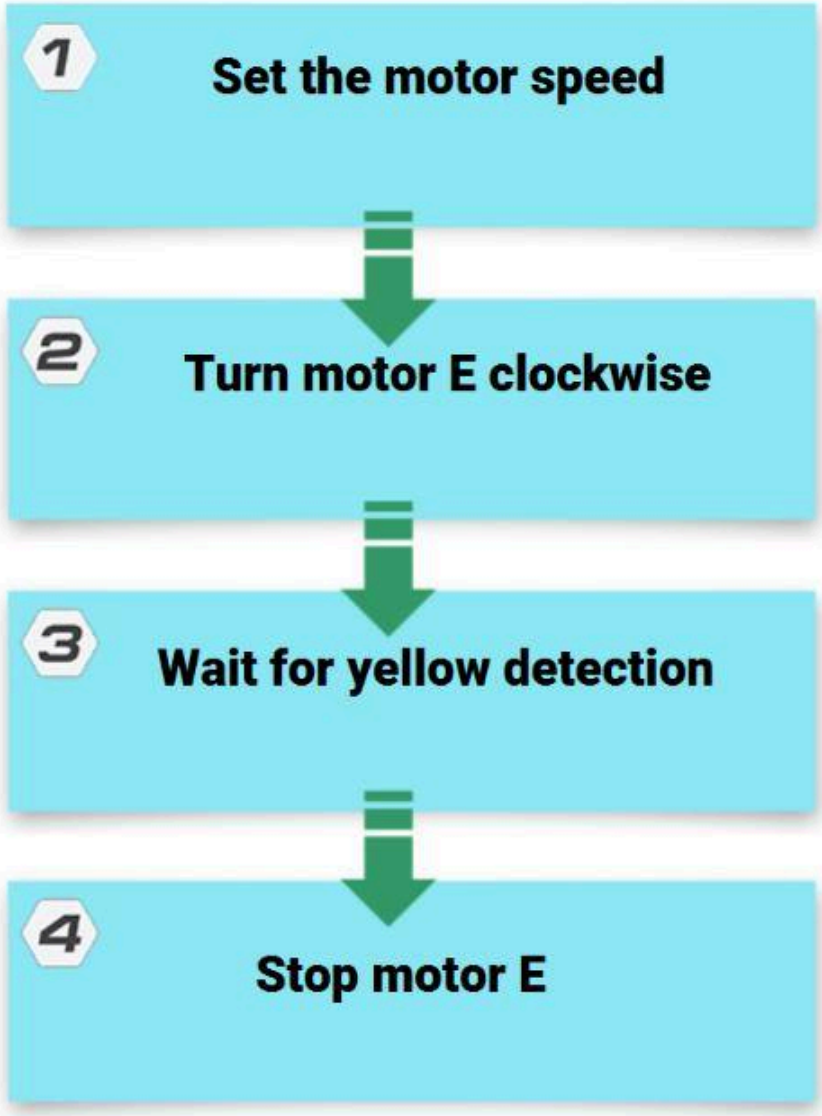

Calculate the number of retations of the motor needed to cover the distance you measured in the previous task. To do this, divide it by the distance covered by the robot during one retation of the motor. You will get the number of retations of the motor needed.

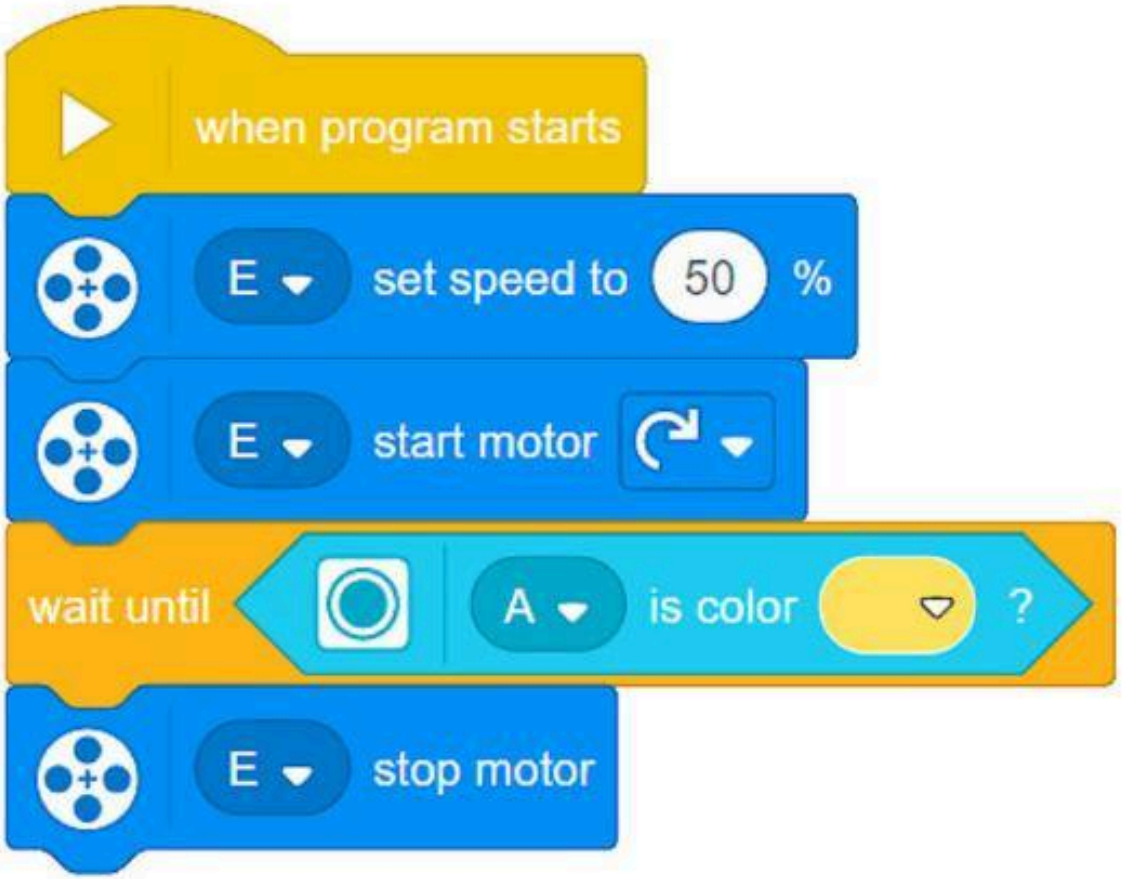

The program for this algorithm looks like this:

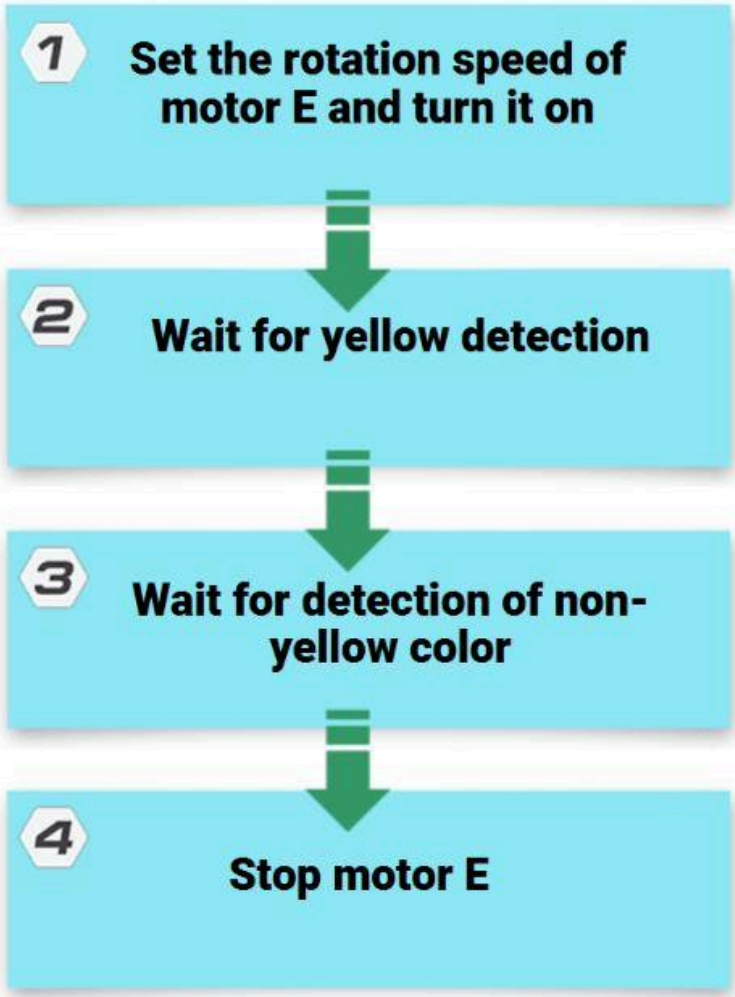

To accomplish the task, the program must work according to the following algorithm:

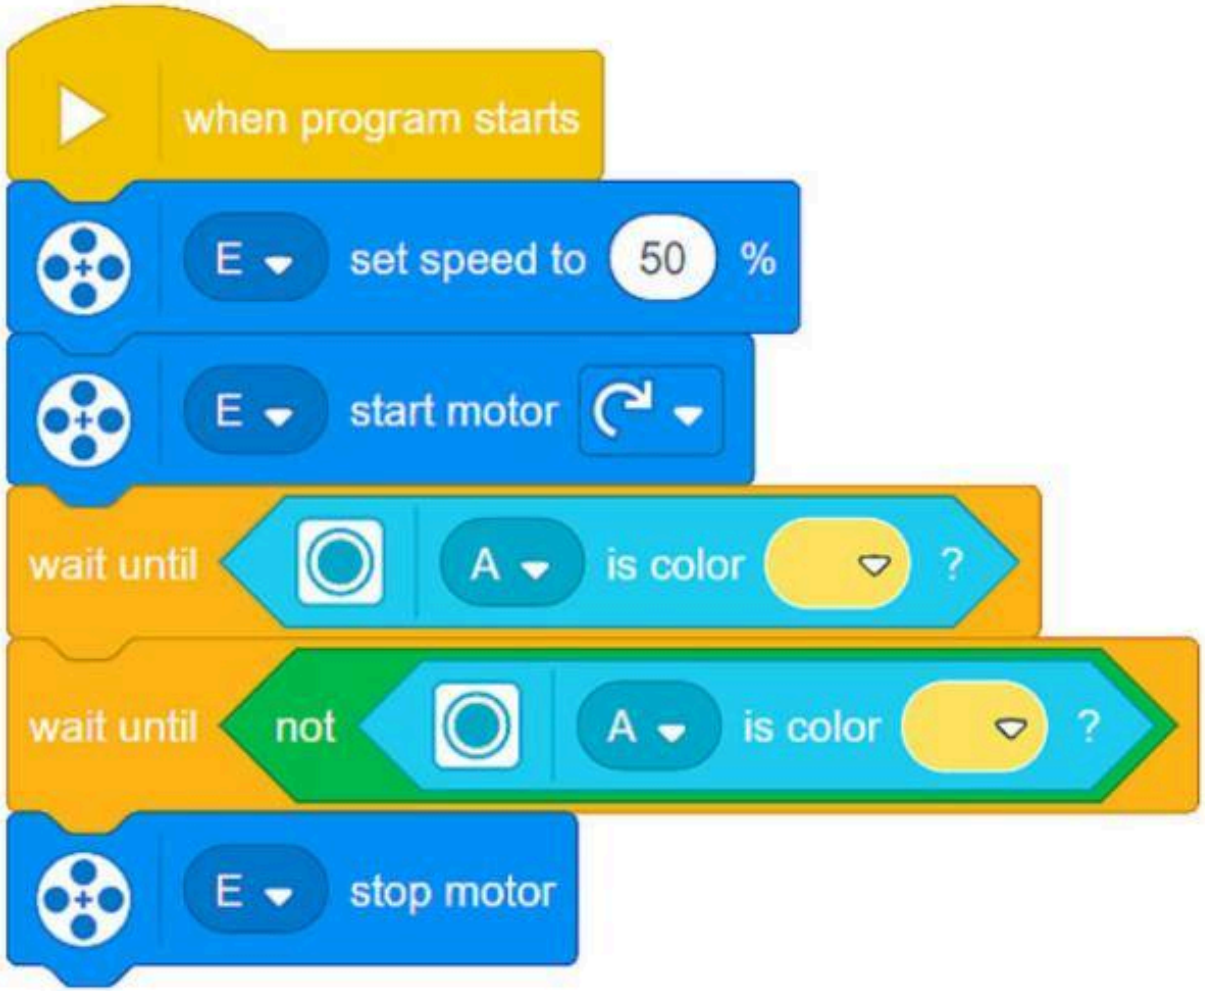

The program might look like this:

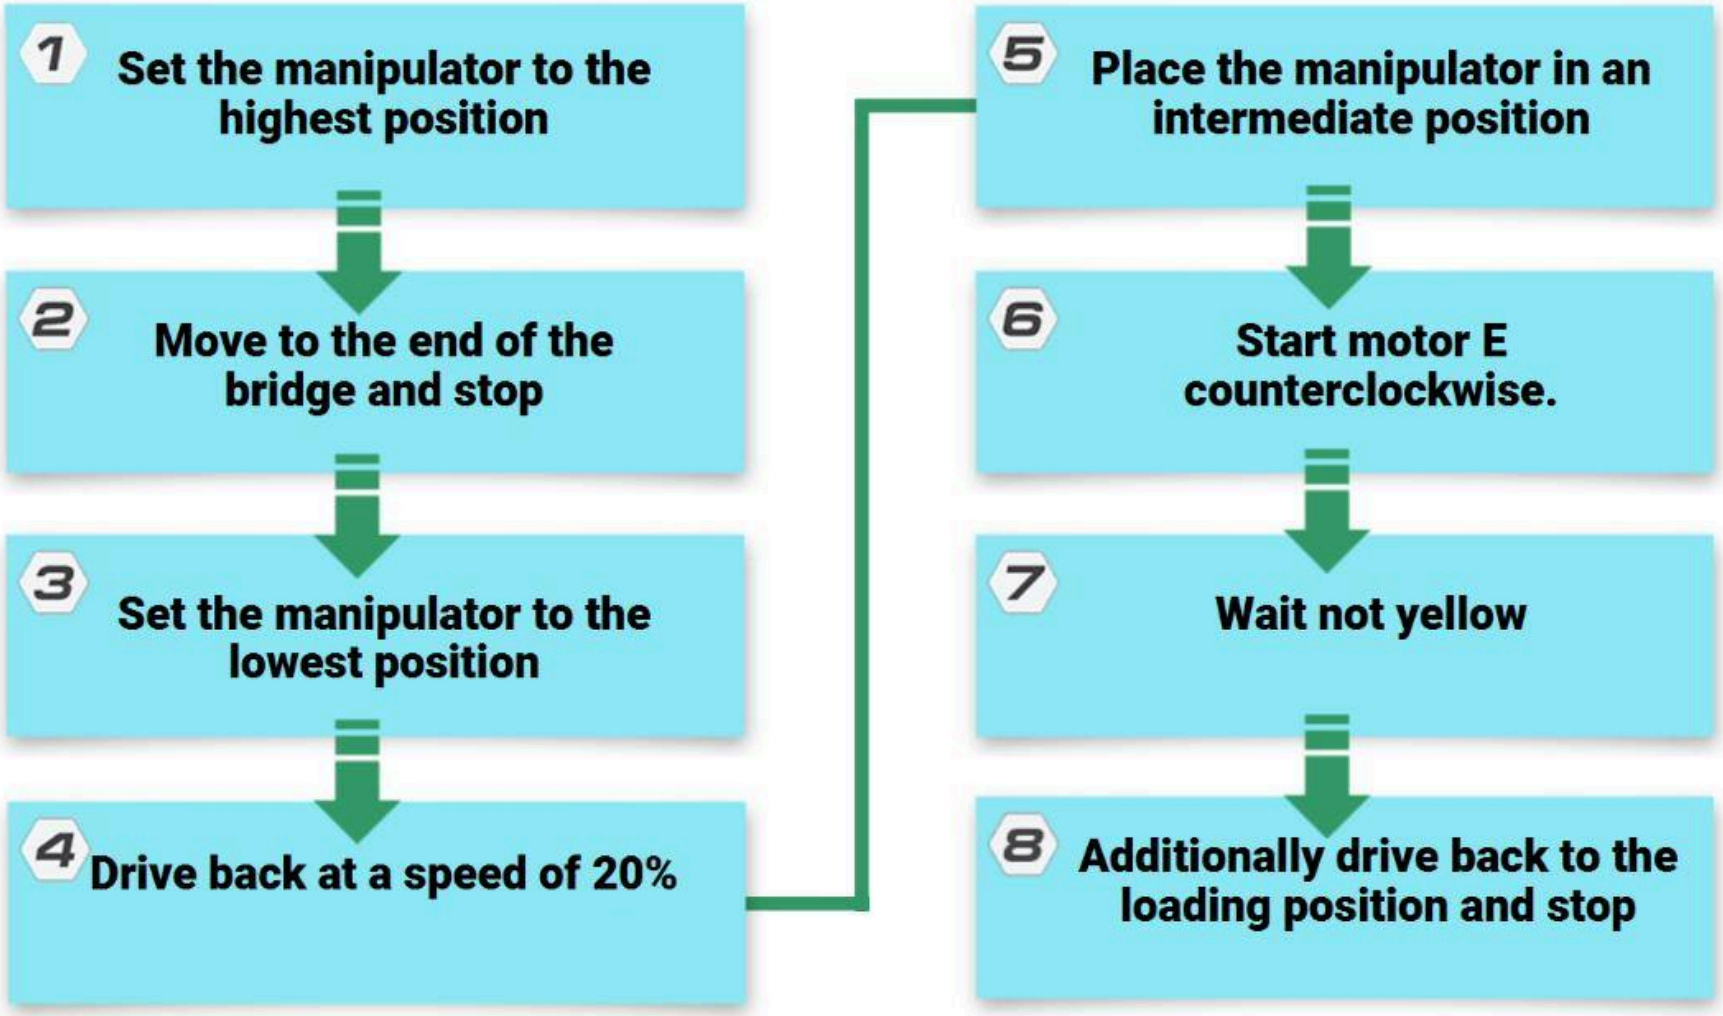

To accomplish the task, the program must work according to the following algorithm:

Add the program as follows:

The task execution algorithm can be as follows:

Add the program as follows:
