To accomplish the task, the program must work according to the following algorithm:

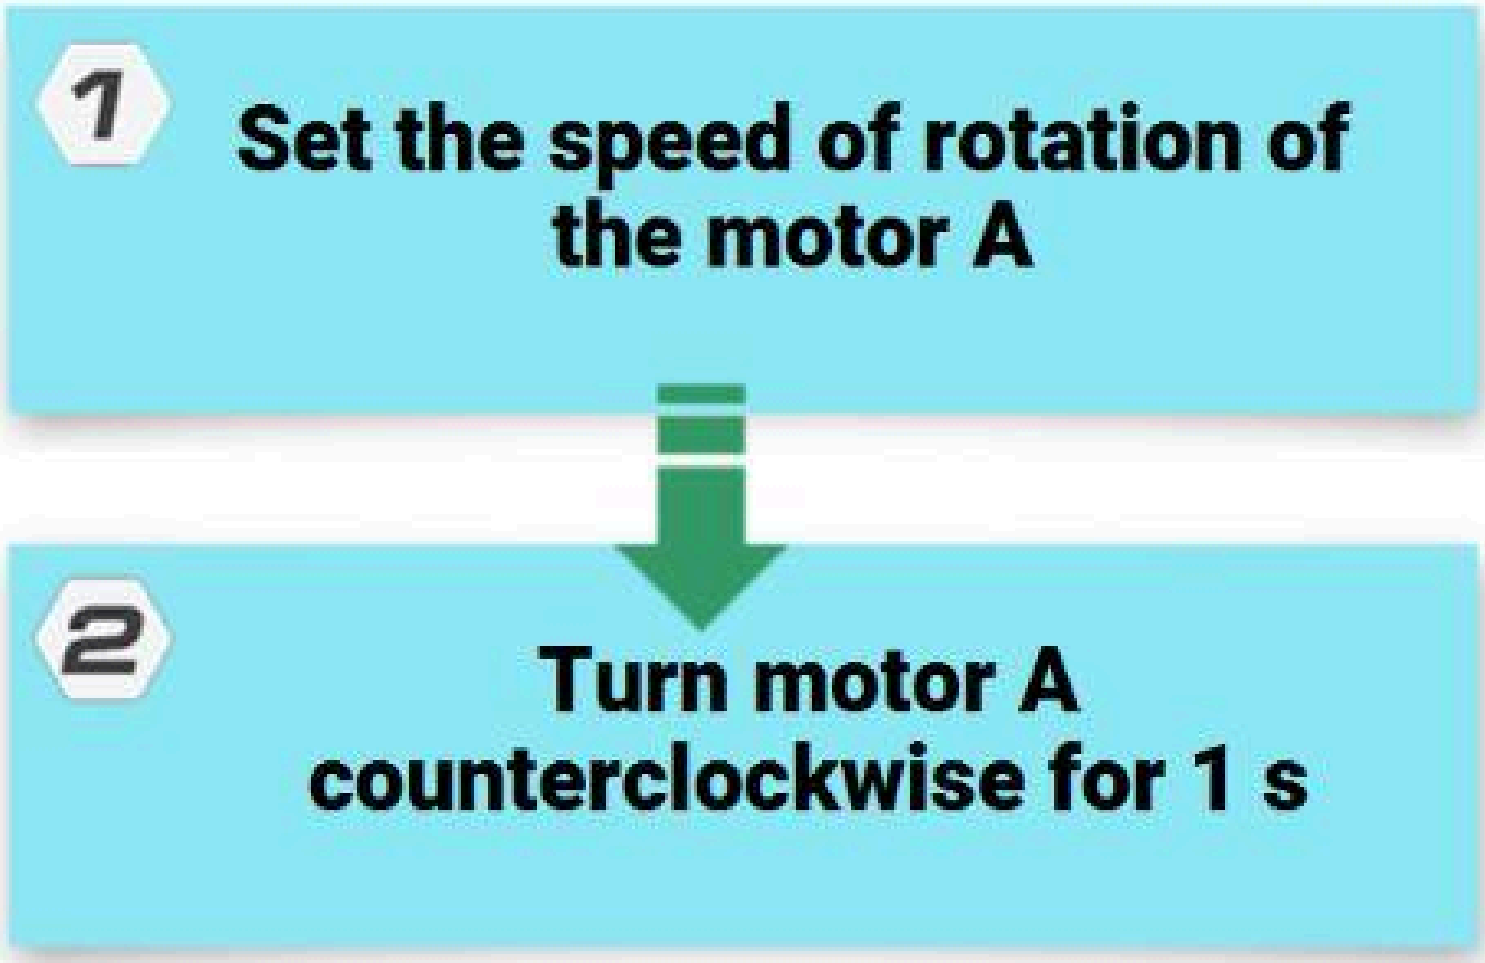

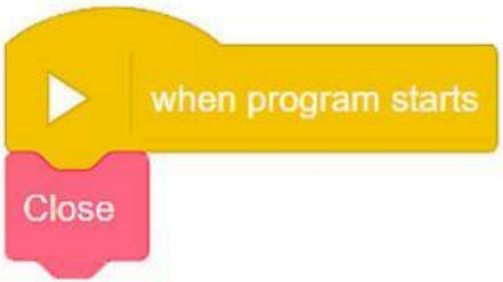

The program might look like this:

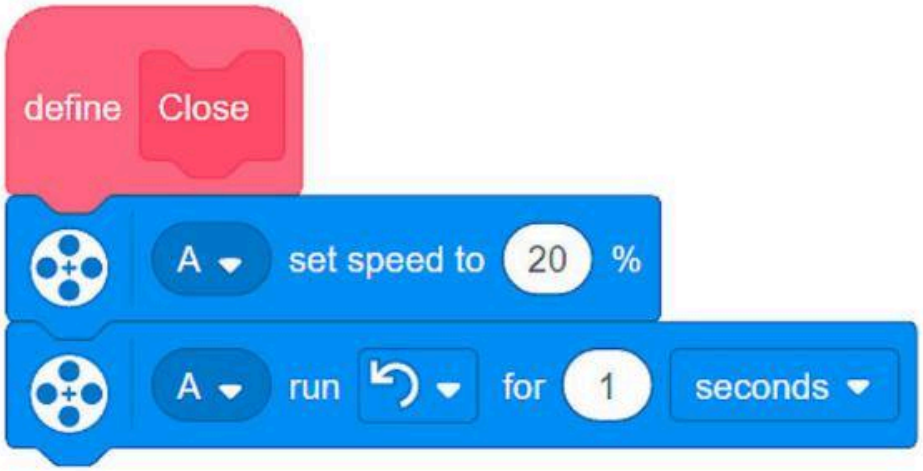

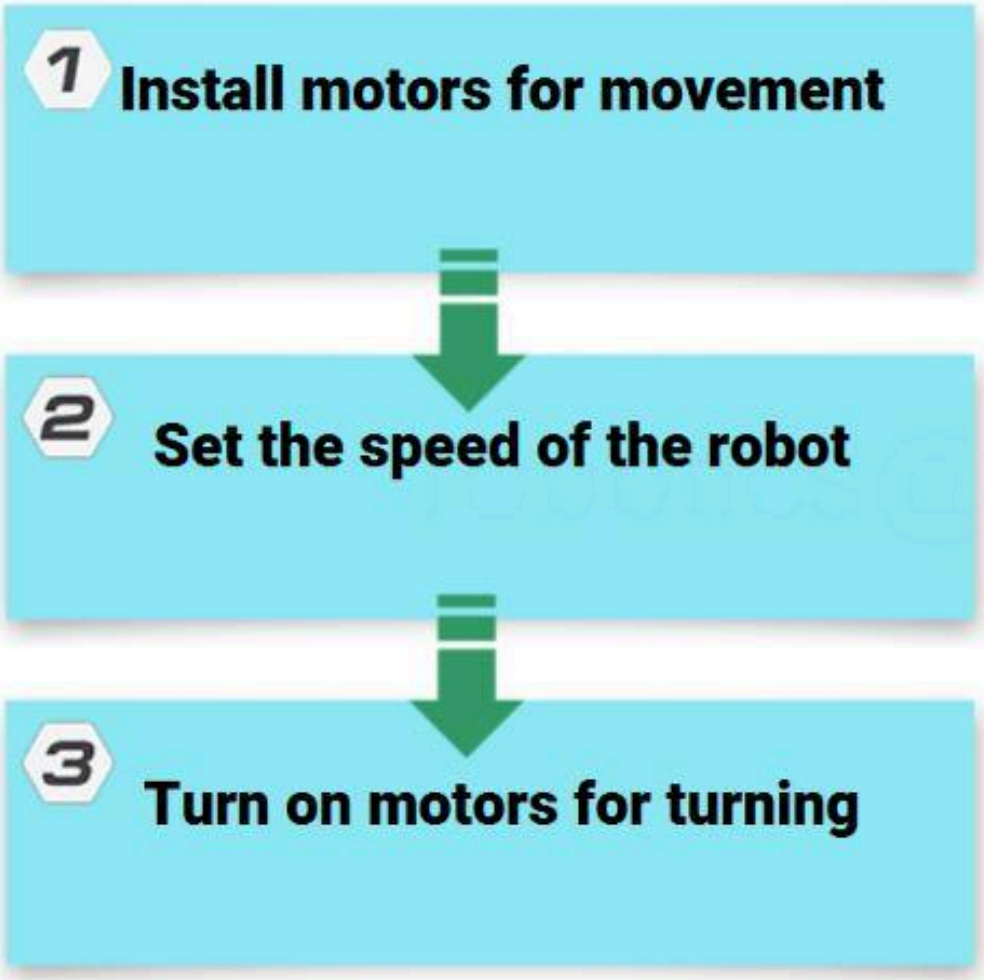

botics@littlealphas.com.au

1
Set the speed of rotation of the motor A
2
Turn motor A counterclockwise for 1 s

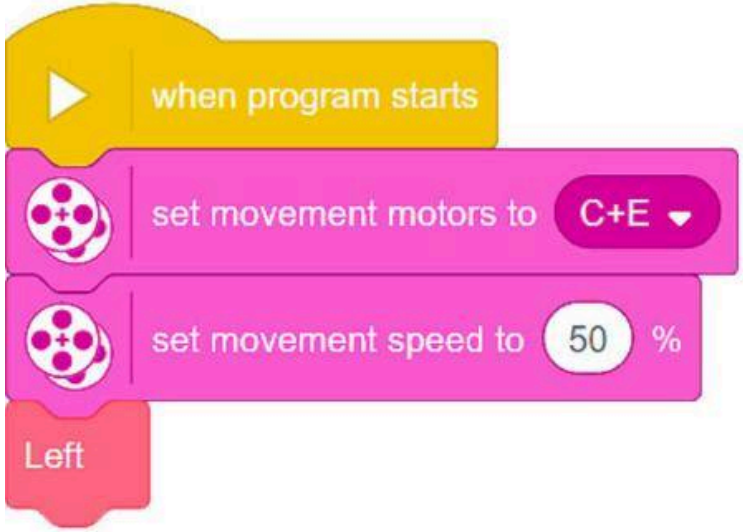

when program starts
Close

define Close
A set speed to 20 %
A run for 1 seconds

The task execution algorithm can be as follows:

The program for this algorithm looks like this:

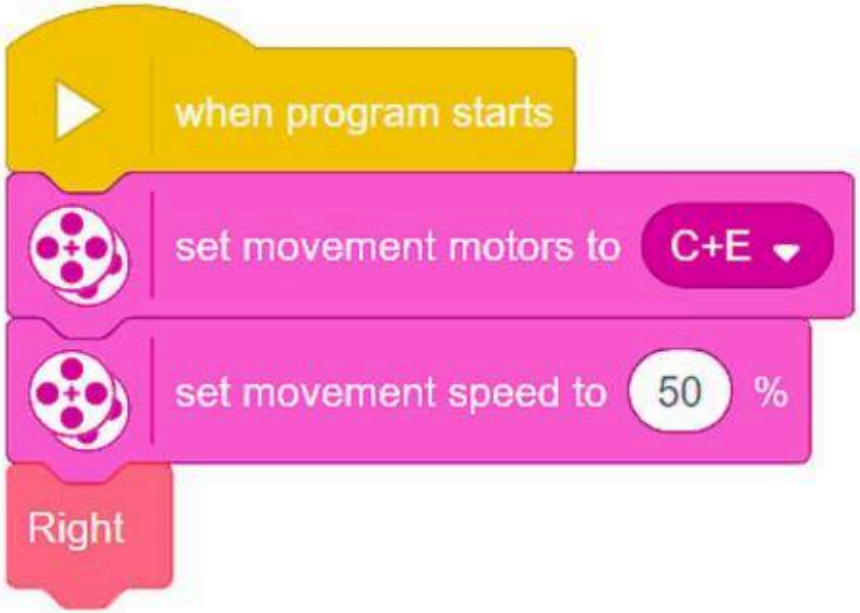

In the subroutine, you can not set the motors for movement and power - they will be set in the main program

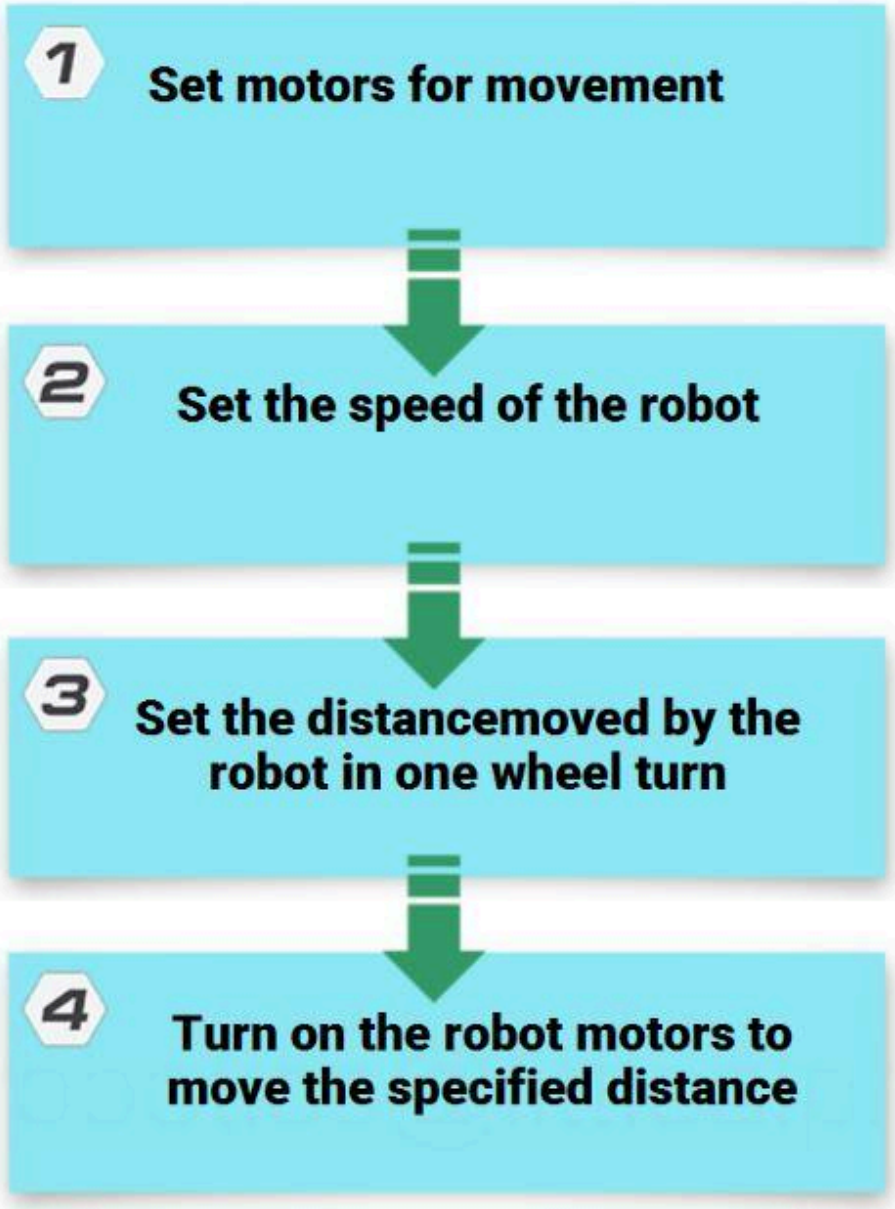

The length of the turn (the number of degrees to be programmed) depends on the path of the robot and the diameter of the wheels. Adjust the duration so that the robot will return 90 degrees to the left.

Similar to the previous task, the programs may look like this:

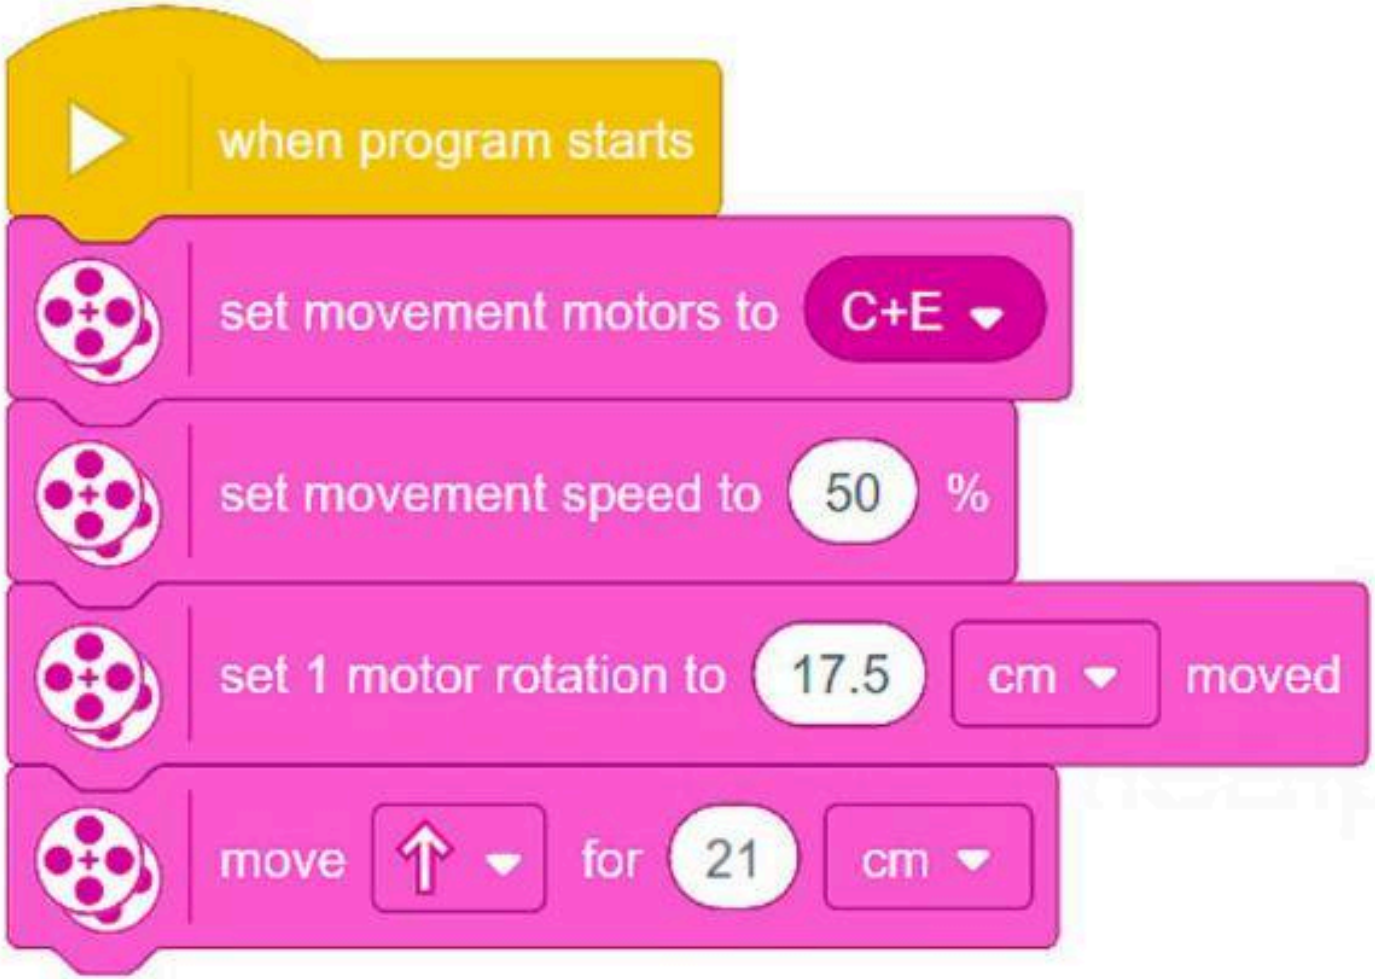

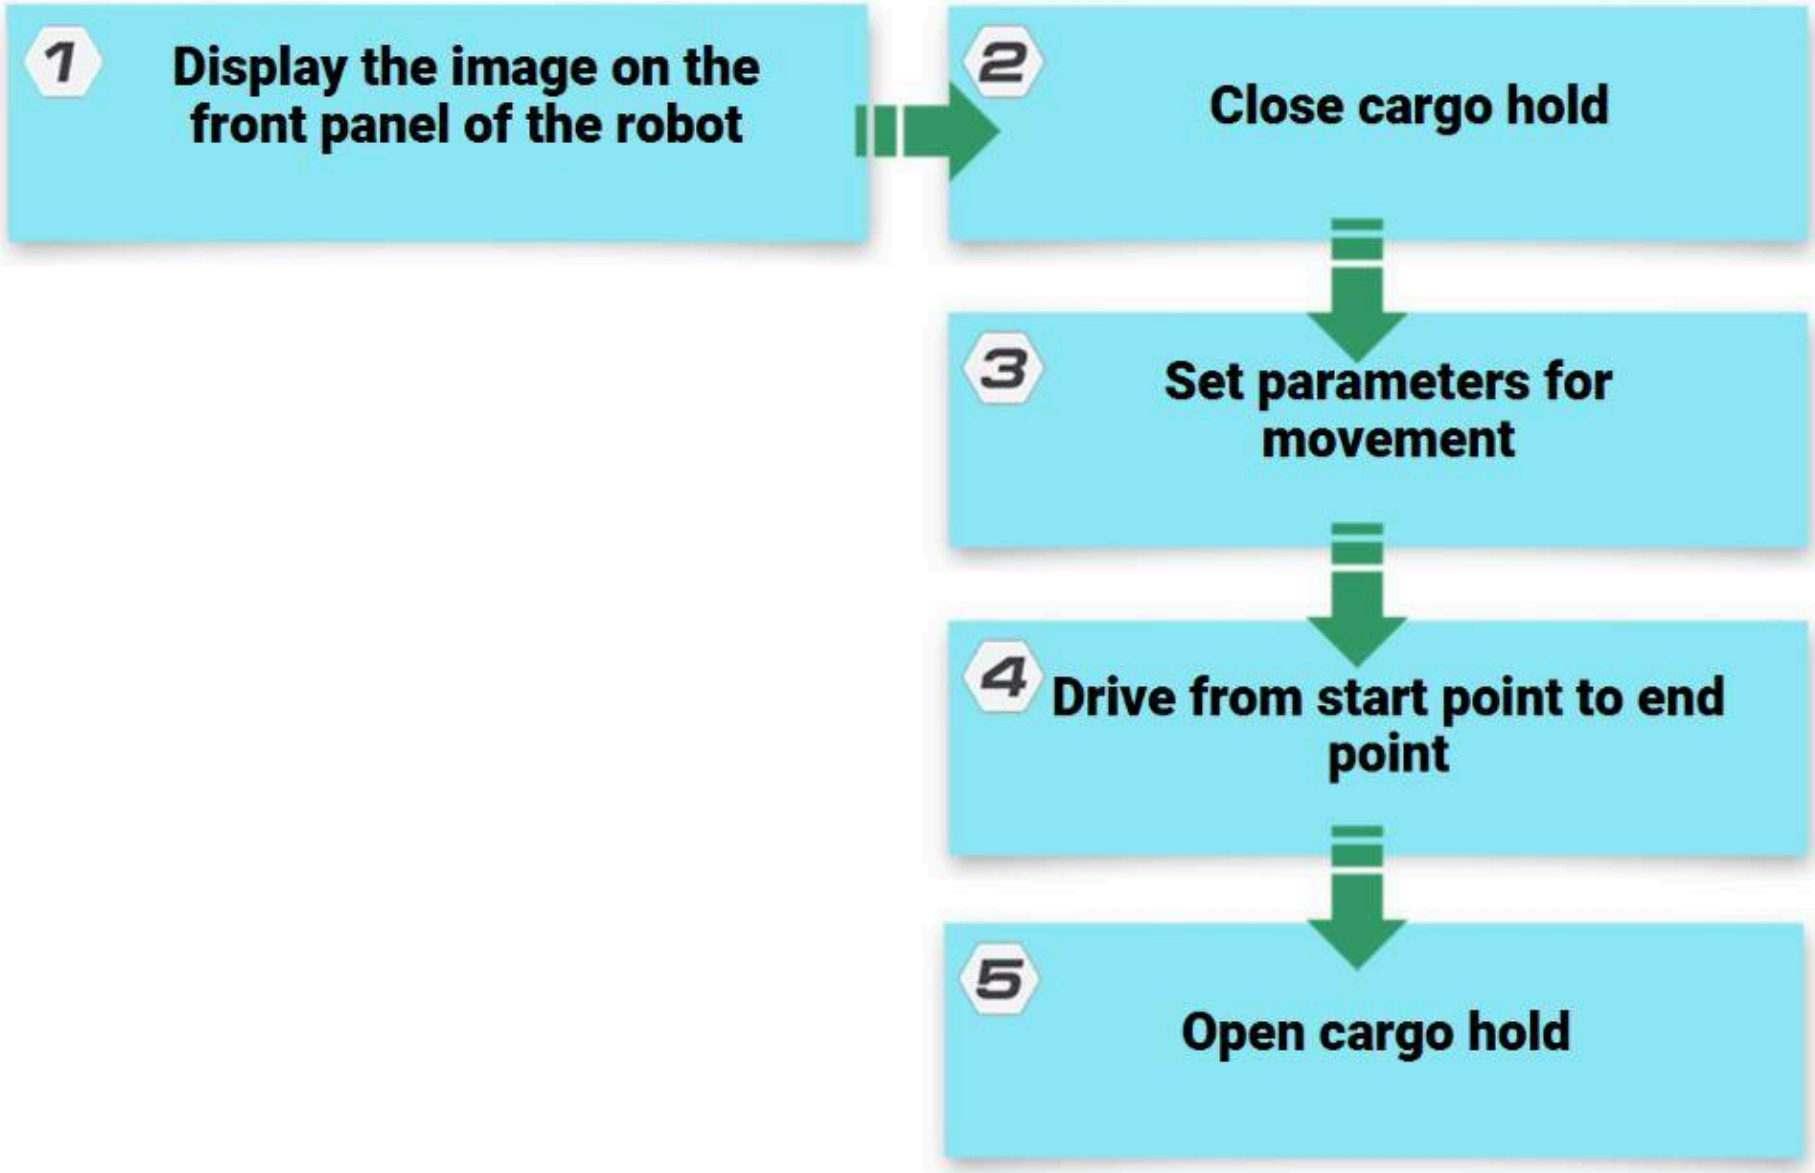

The setup algorithm is as follows:

The program looks like this:

The program should work according to the following algorithm:

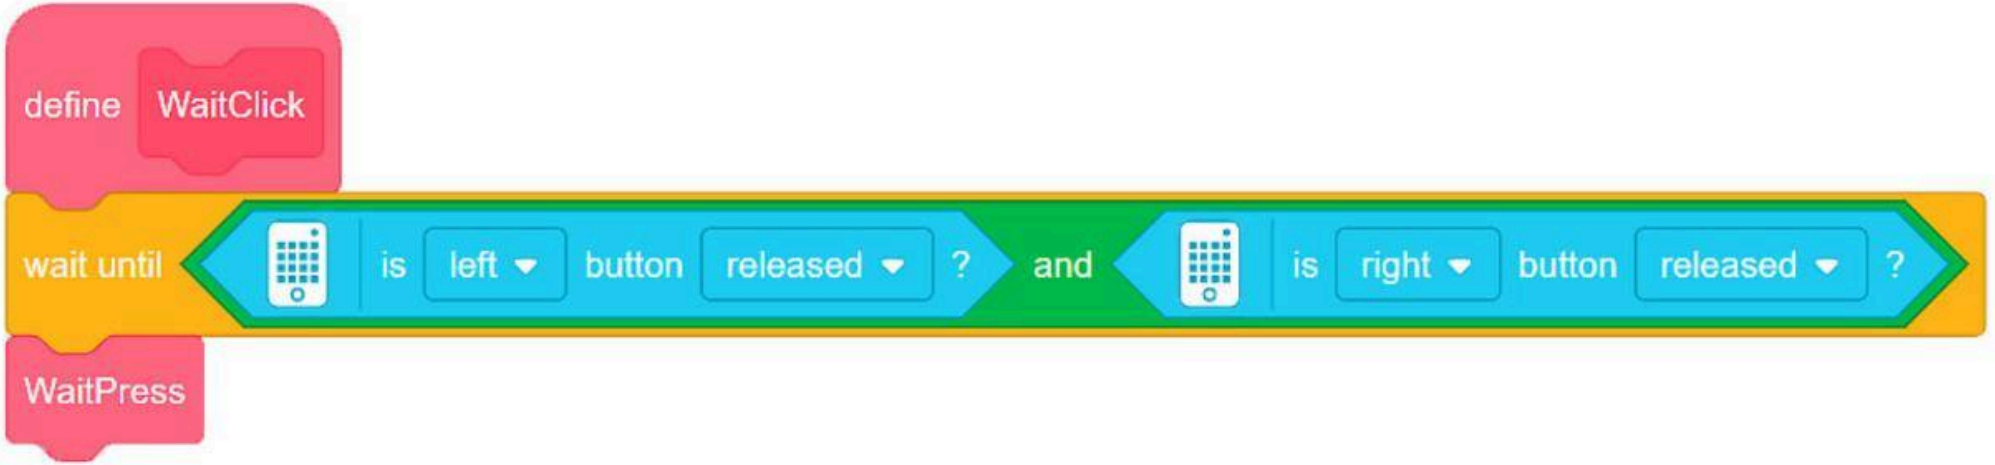

A program using this algorithm may look like this:

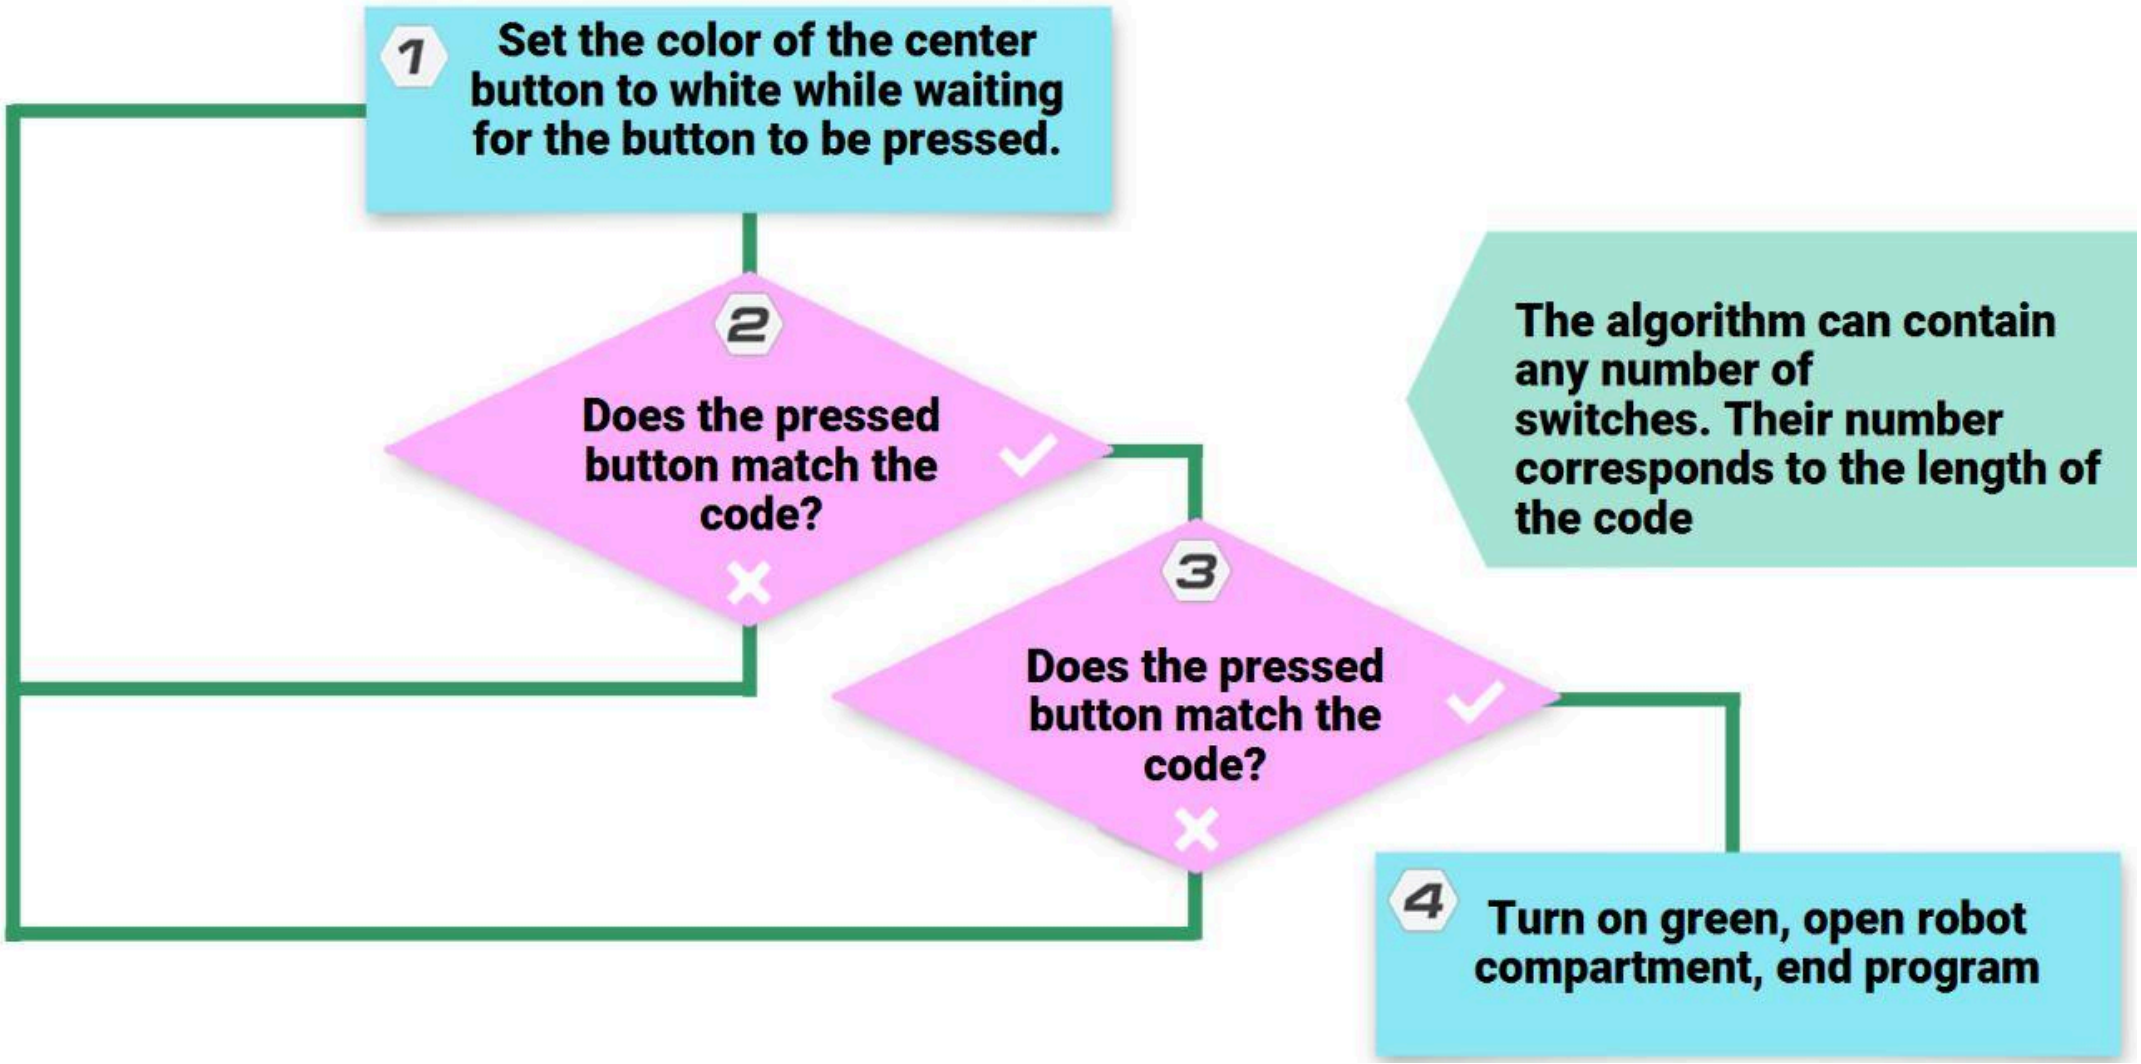

The duration of passes and the sequence of turns depends on the position of the start and end points of the delivery route you have set.

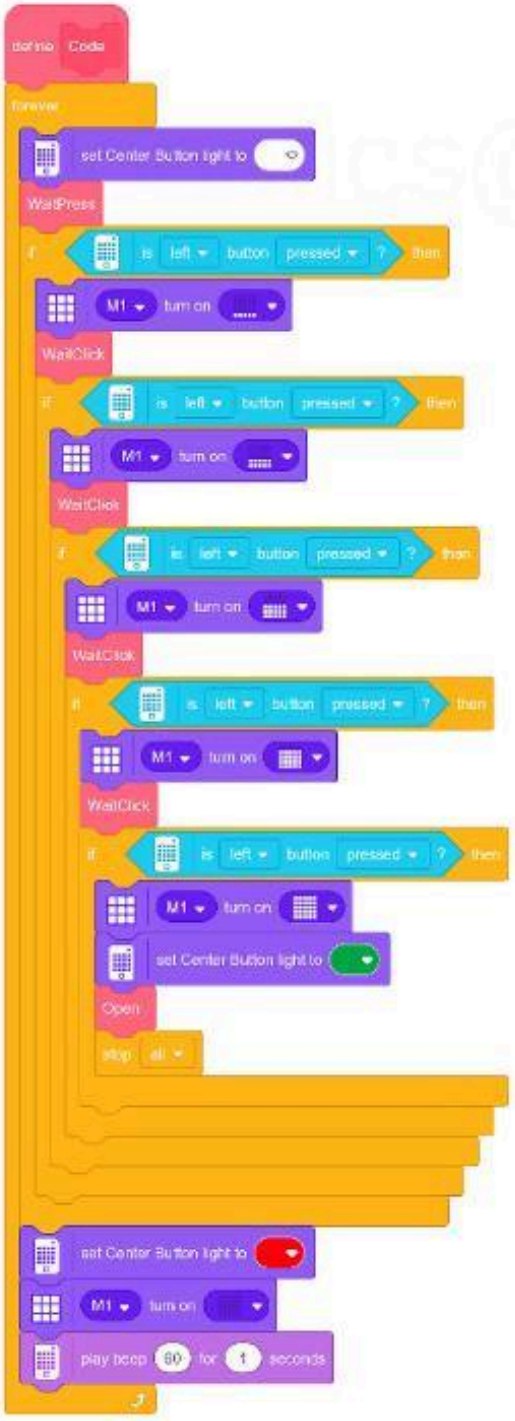

Create two subroutines that will wait for one of the buttons to be pressed and wait for all buttons to be released:

The algorithm of the subroutine for waiting for code input is as follows:

Come up with a sequence code and select the left or right button according to your code

Change the last program, replacing the opening of the luggage compartment with waiting for the entry of the pin code:
