Programs might look like this:

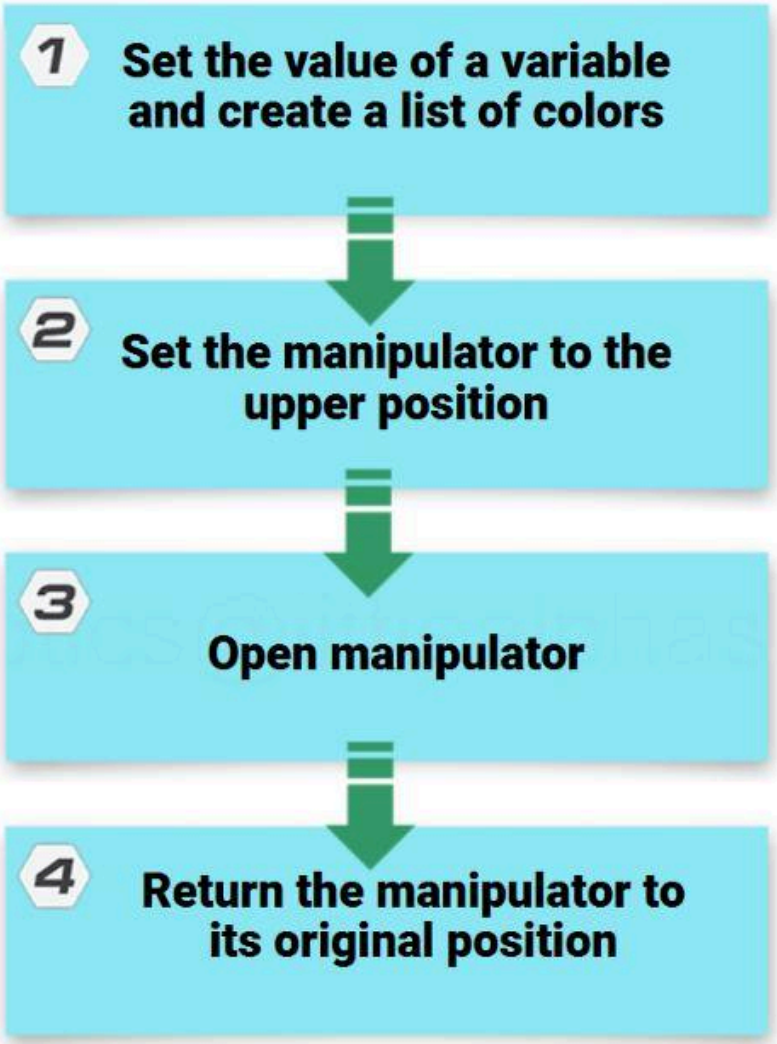

Programs might look like this:

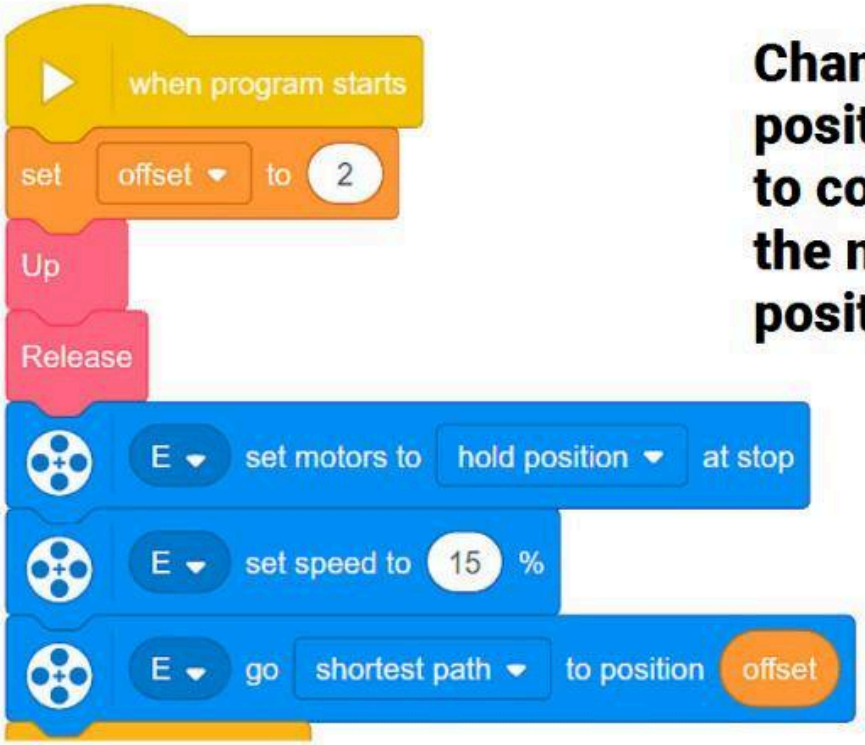

The task execution algorithm can be as follows:

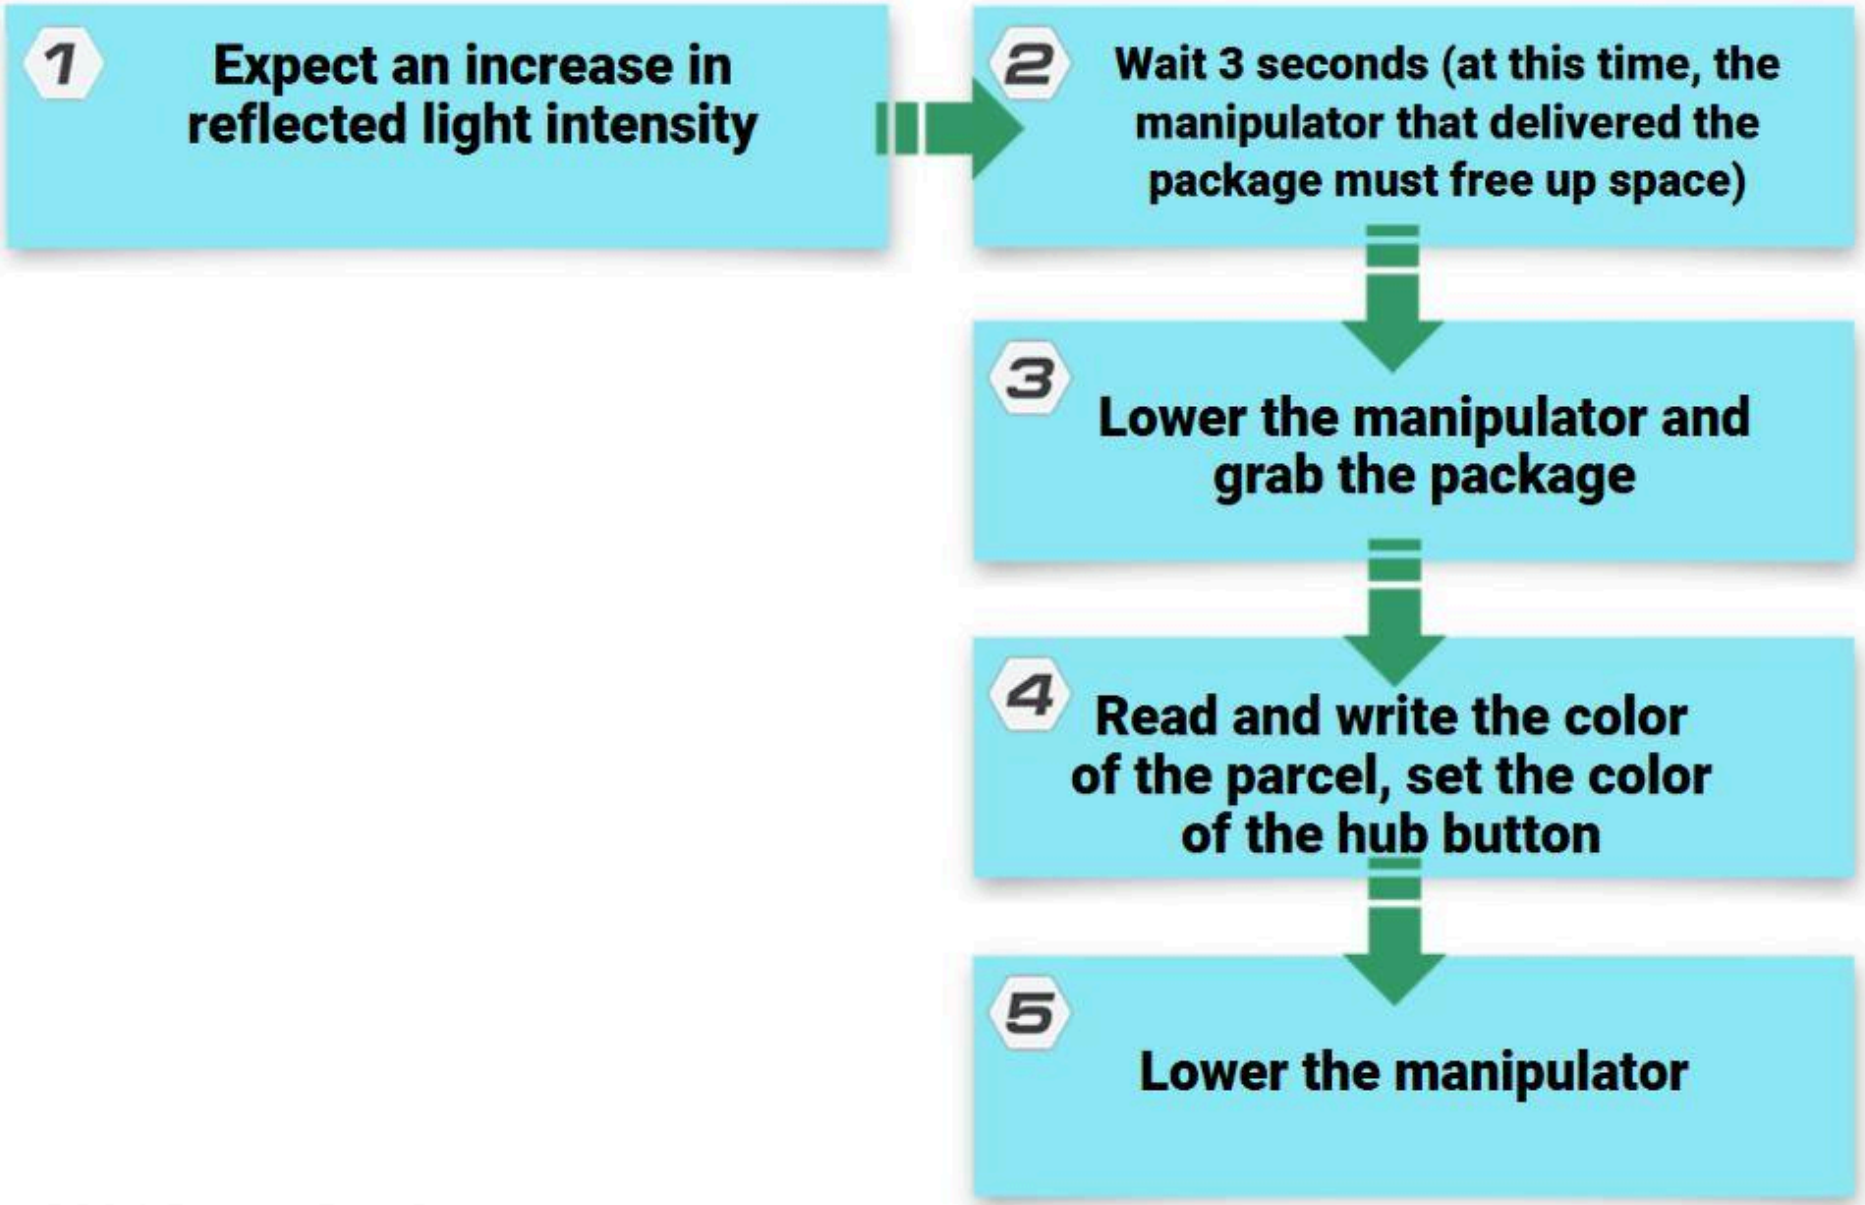

Note! For the legal movement of the manipulator, it is necessary to align the marks on the motor and install the manipulator on the base of the robot in the direction of the point where the parcels are placed.

The program for this algorithm looks like this:

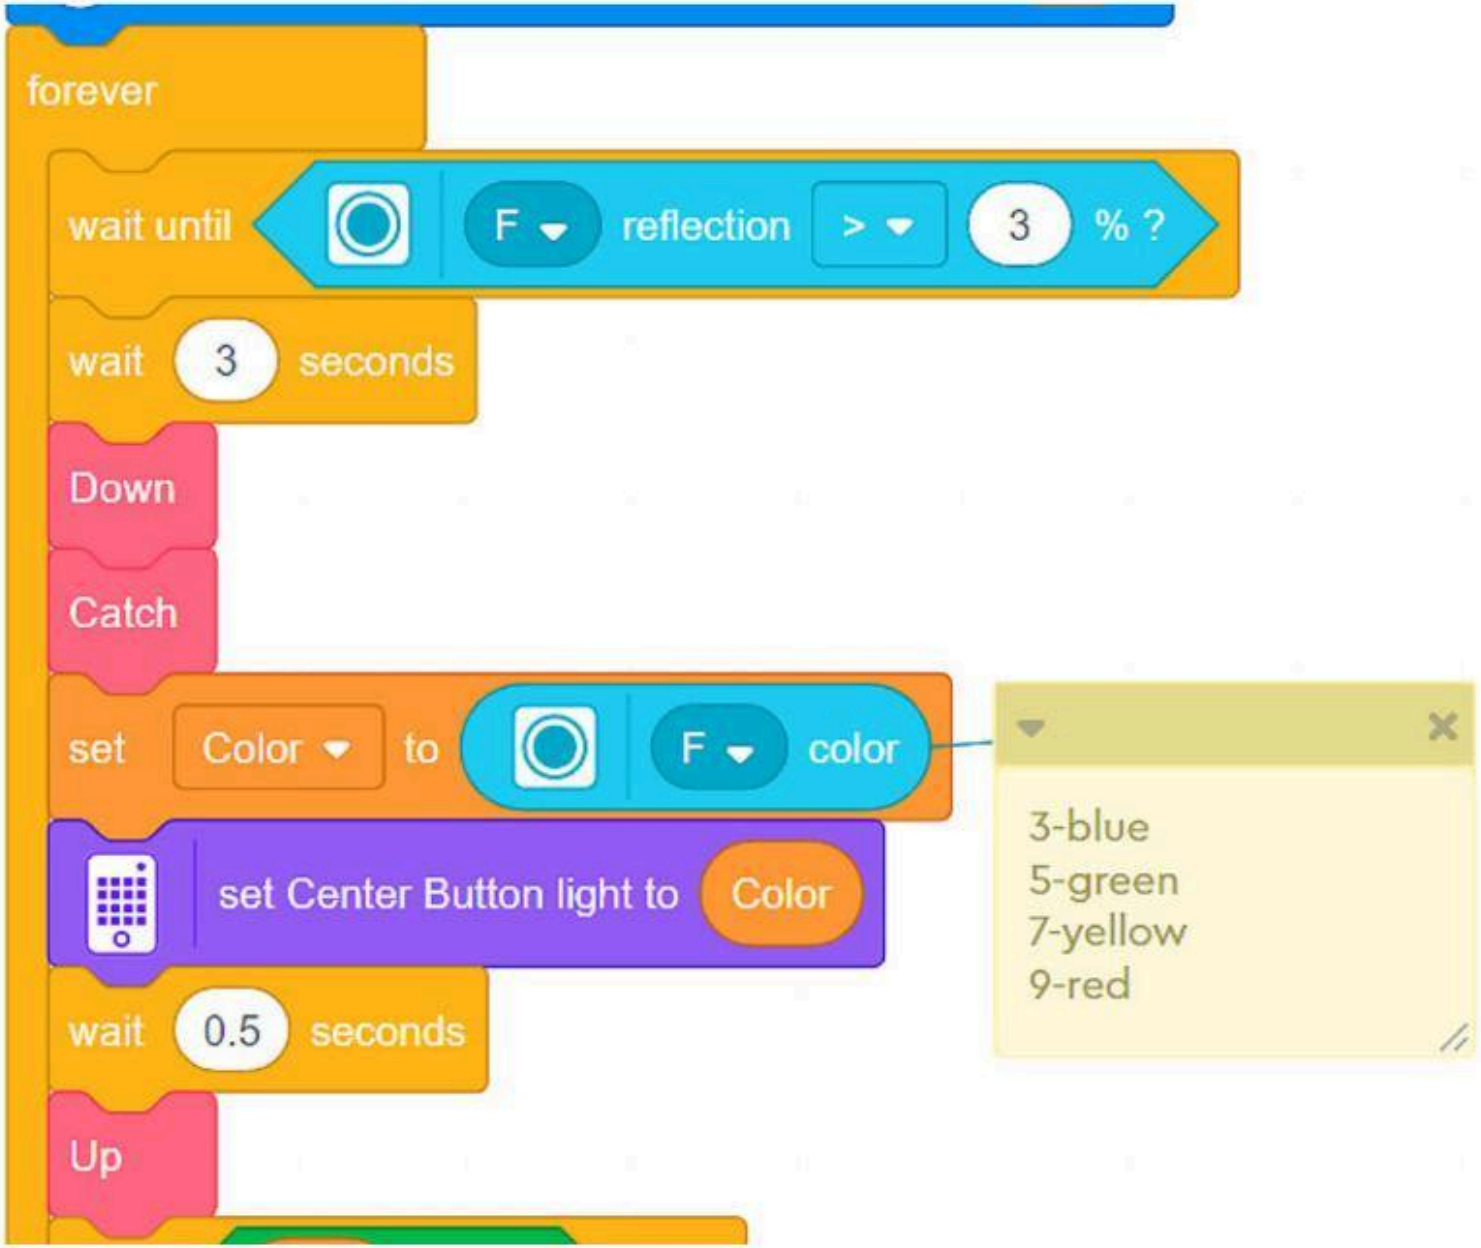

Changeable 'offset' is needed in order to fine-tune the position of the manipulator. It is almost never possible to connect the marks on the motor so that at '0' degrees the manipulator is returned exactly to the appropriate position.

The algorithm will change as follows:

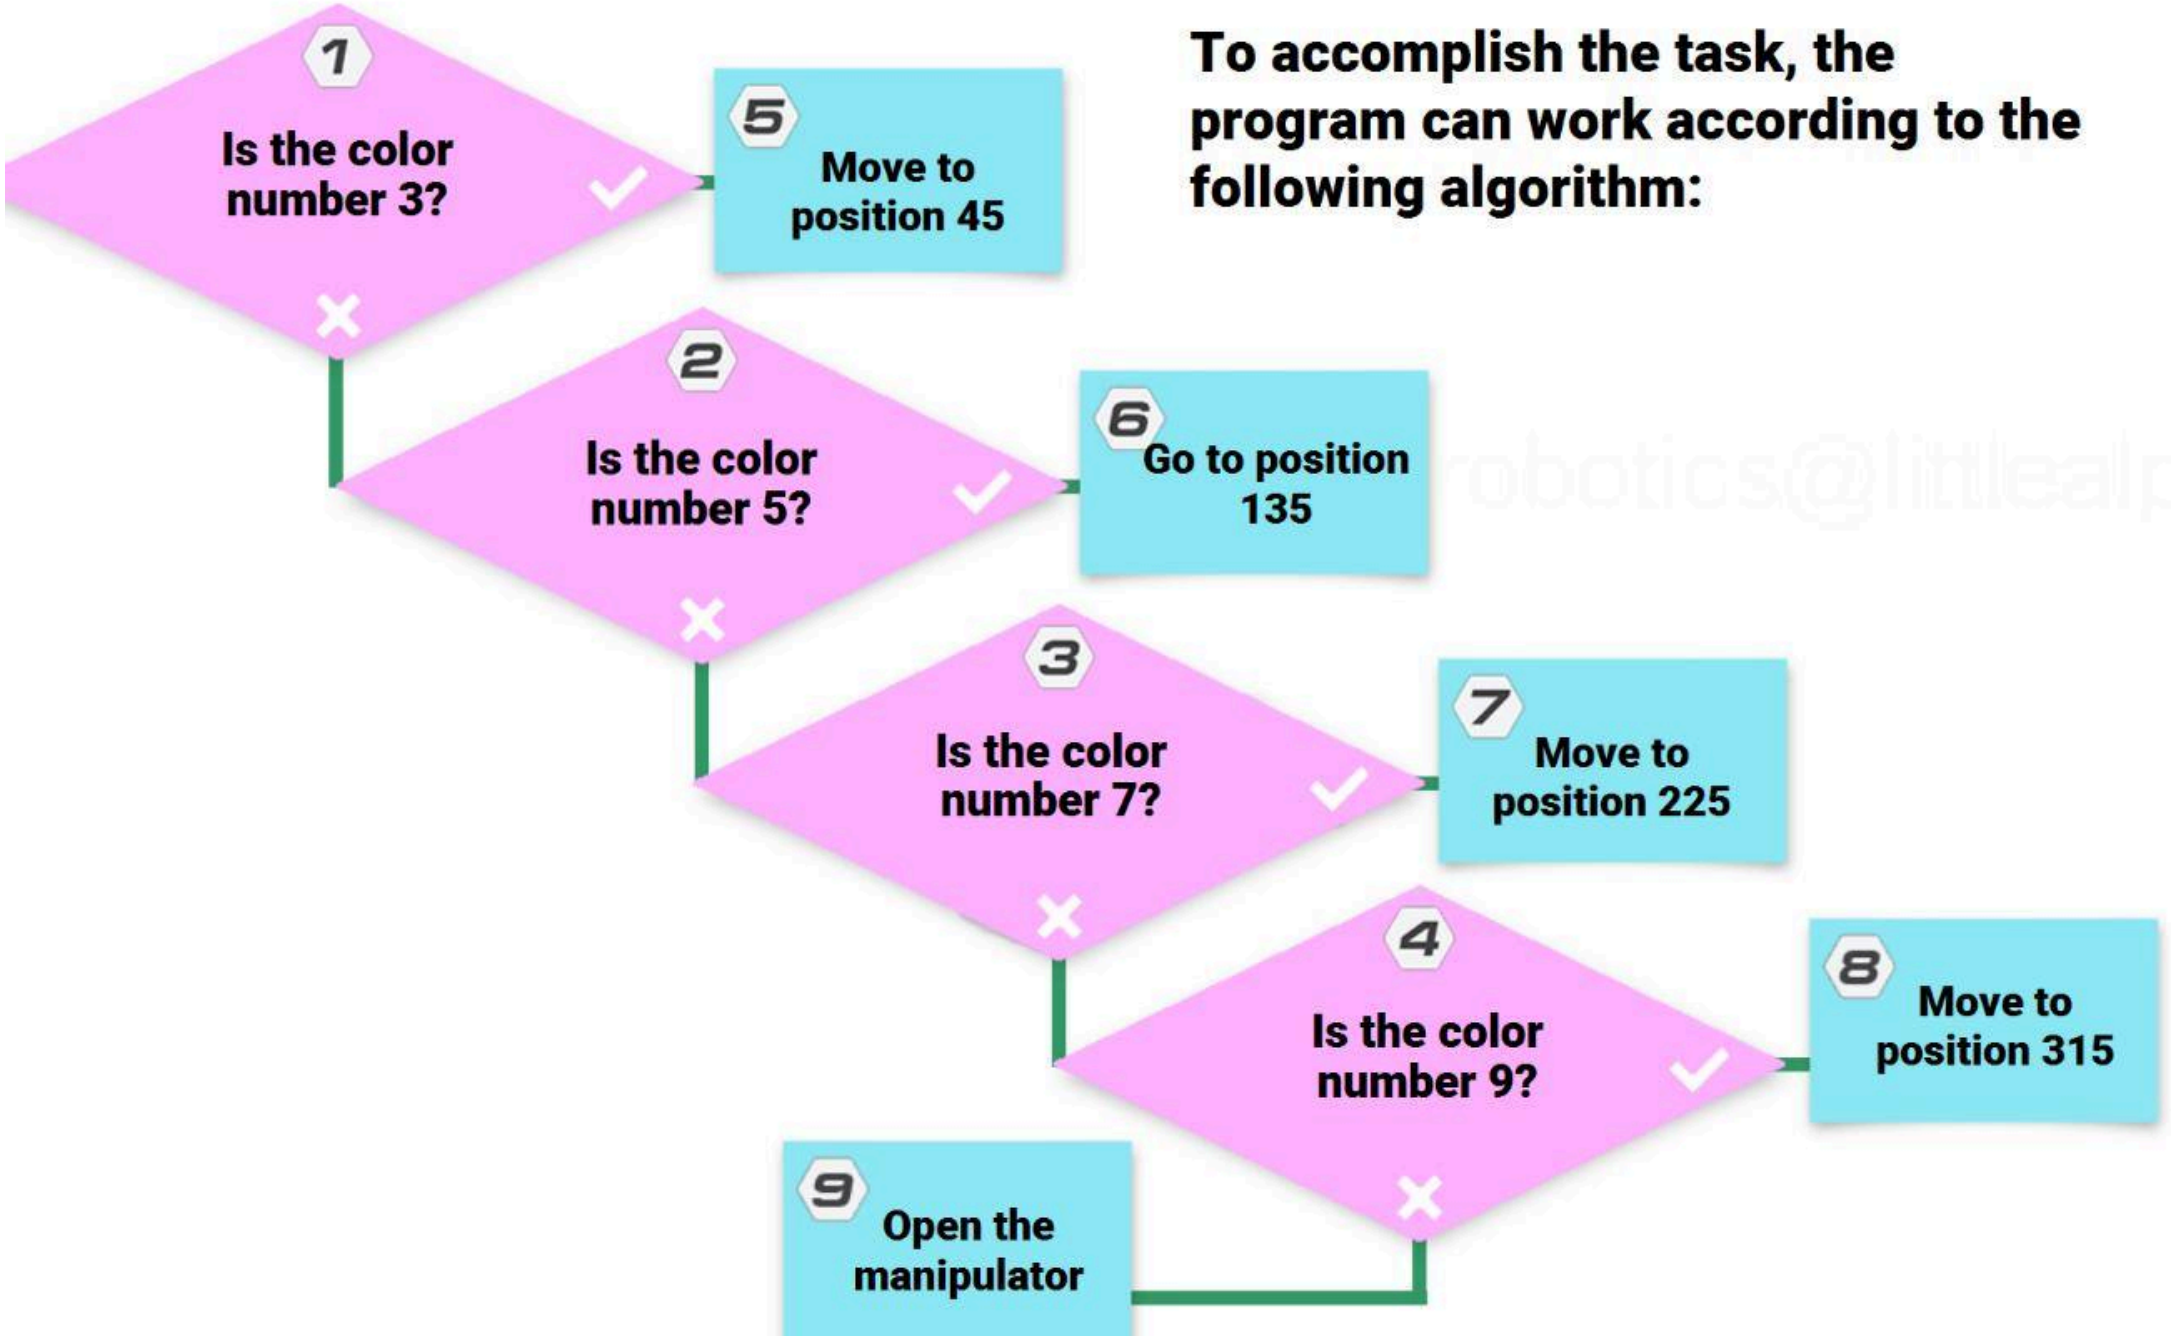

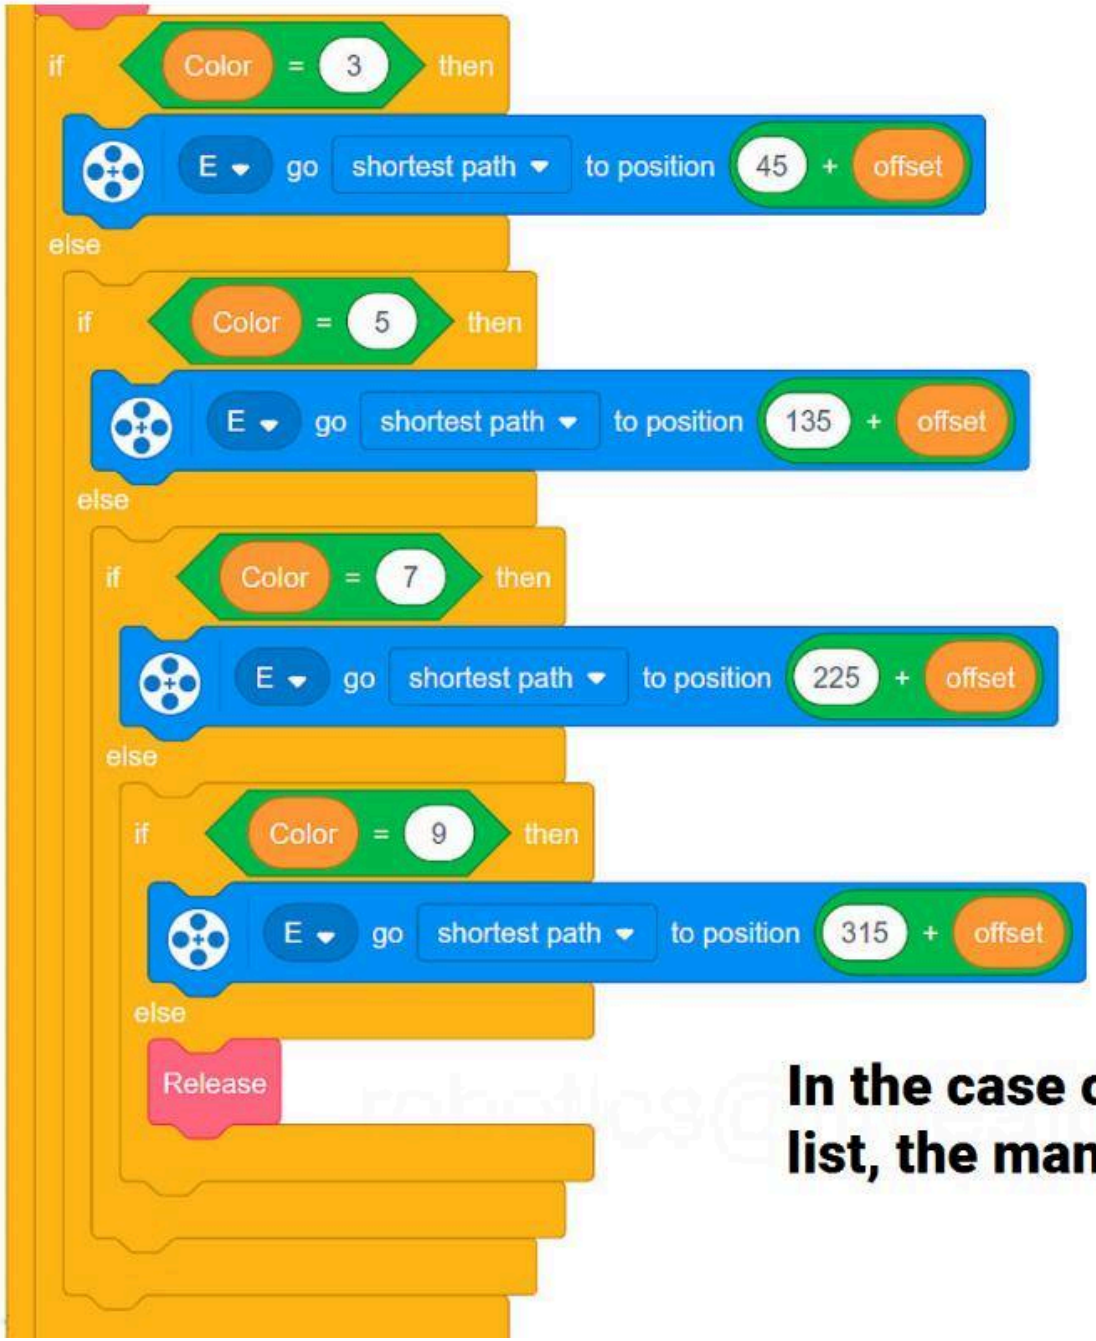

littlealphas.com.au

The program for this algorithm looks like this:

To accomplish the task, the program can work according to the following algorithm:

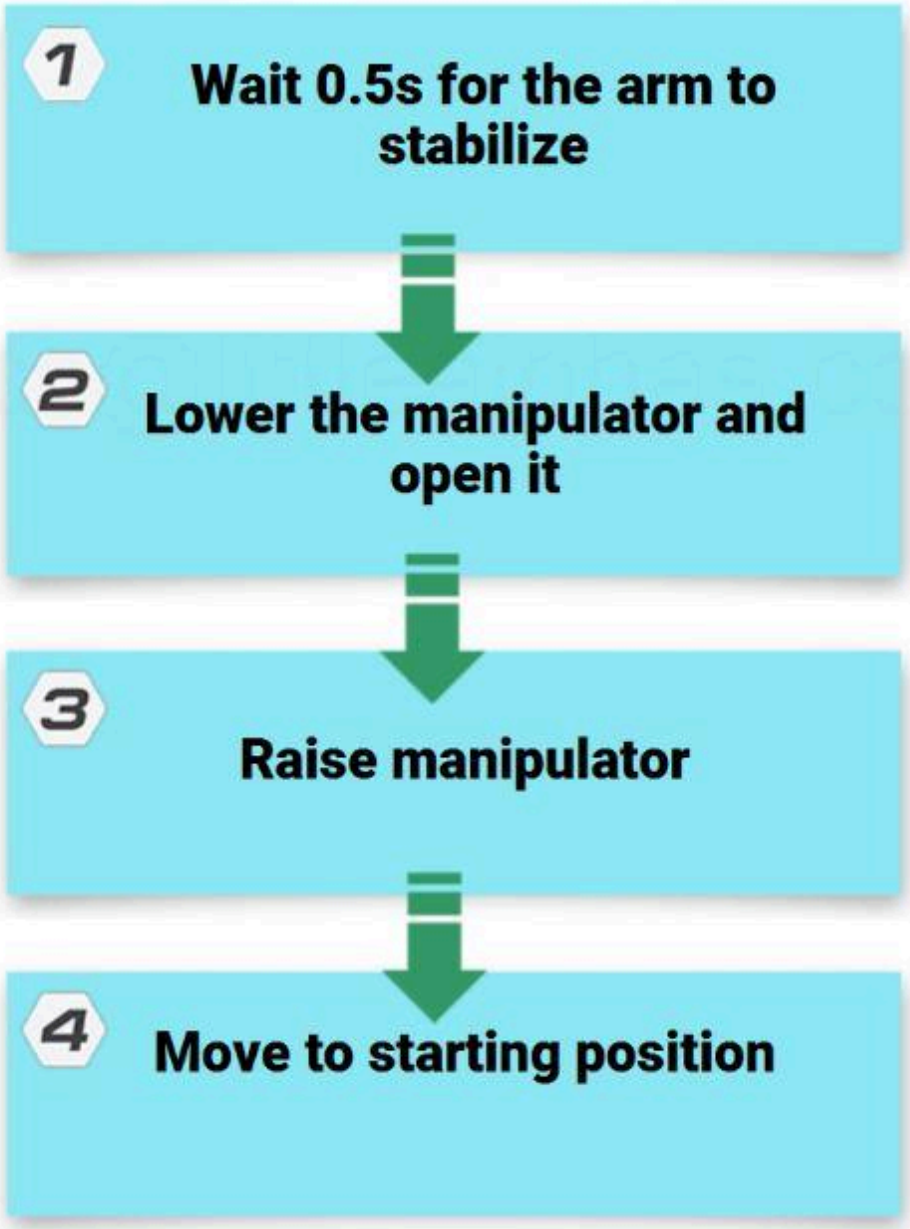

Each color has one of four rotation angle values. When testing the robot, it may be necessary to correct these values!

In the case of detecting any color not included in the list, the manipulator moves to its original position.

The algorithm for performing the last part of the task is as follov

wait
0.5
seconds
Down
Release
Up
E
go
shortest path
to position
offset

In general, the program should look like this:

Modify your program. Now the robot should lay out two colors at the same point. For example, for the first robot it looks like this:
