

Volcano

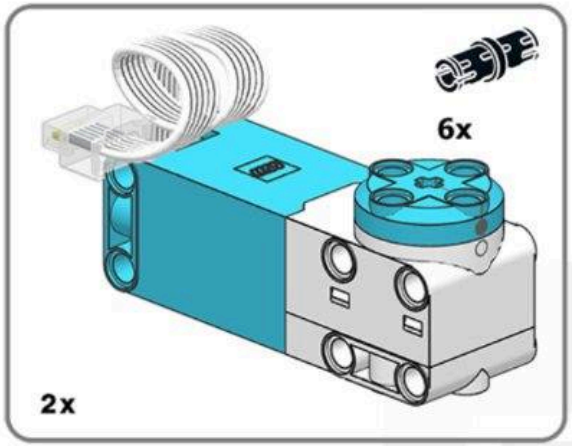

The robot has two medium motors that drive the legs. The ultrasonic sensor is used to detect objects, and the Large motor is used to drive th manipulator.

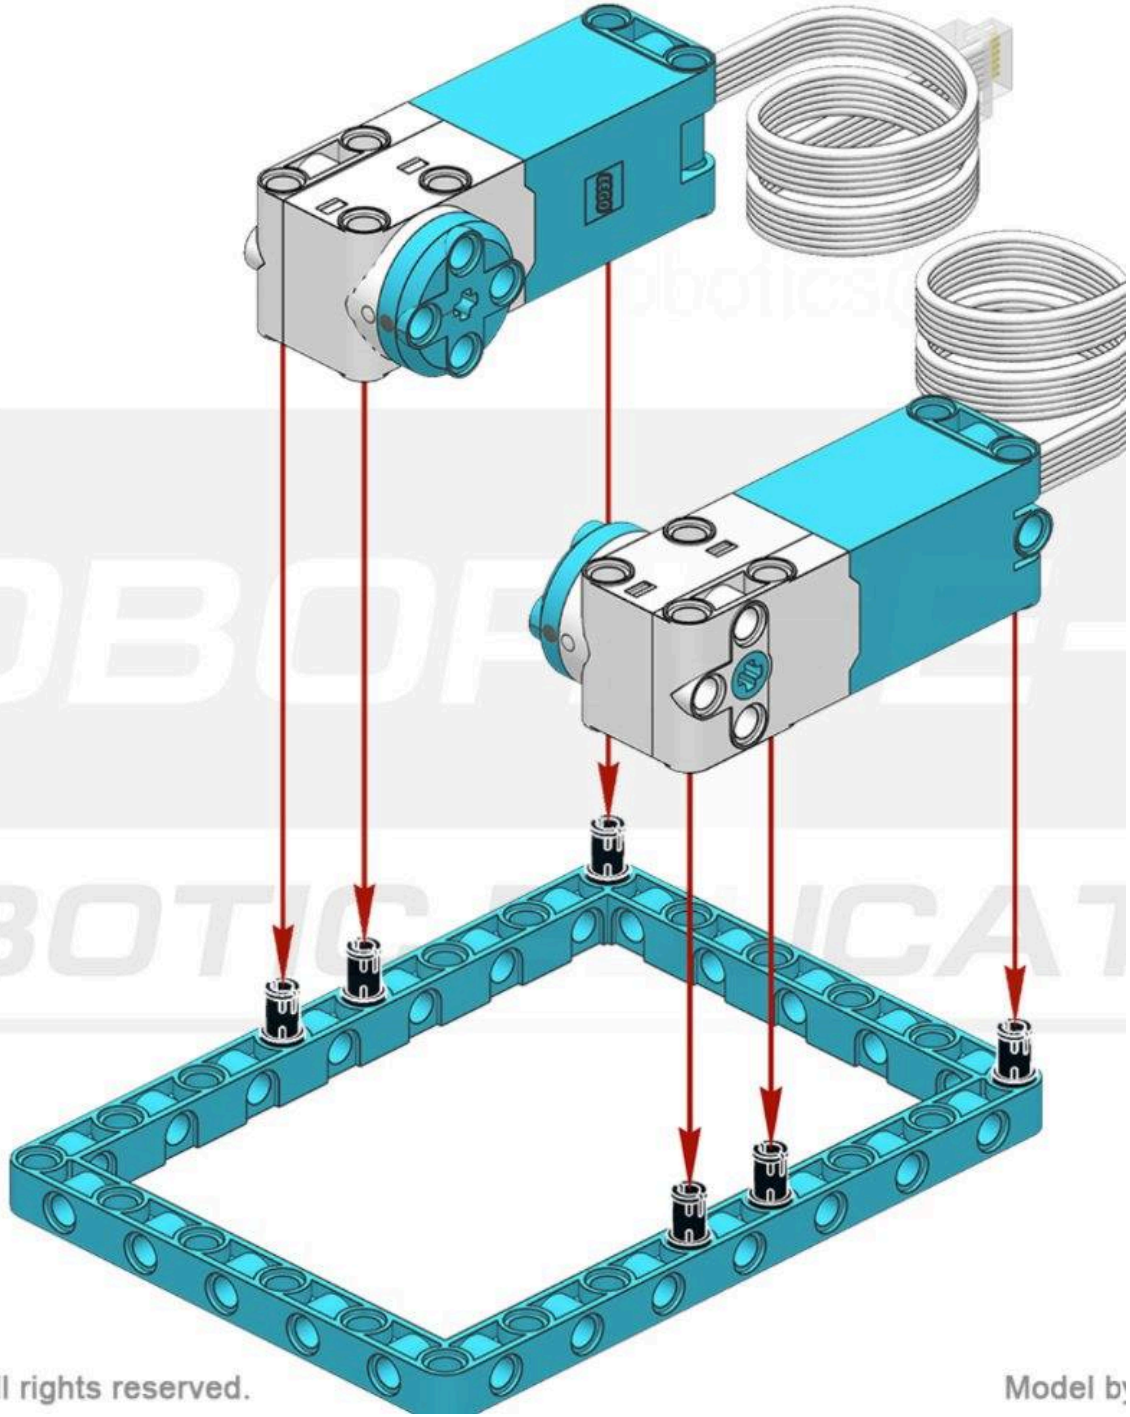

Find:

- **Smarthub**
- **Motors**
- **Distance sensor**

Place the parts of the robot in the correct places

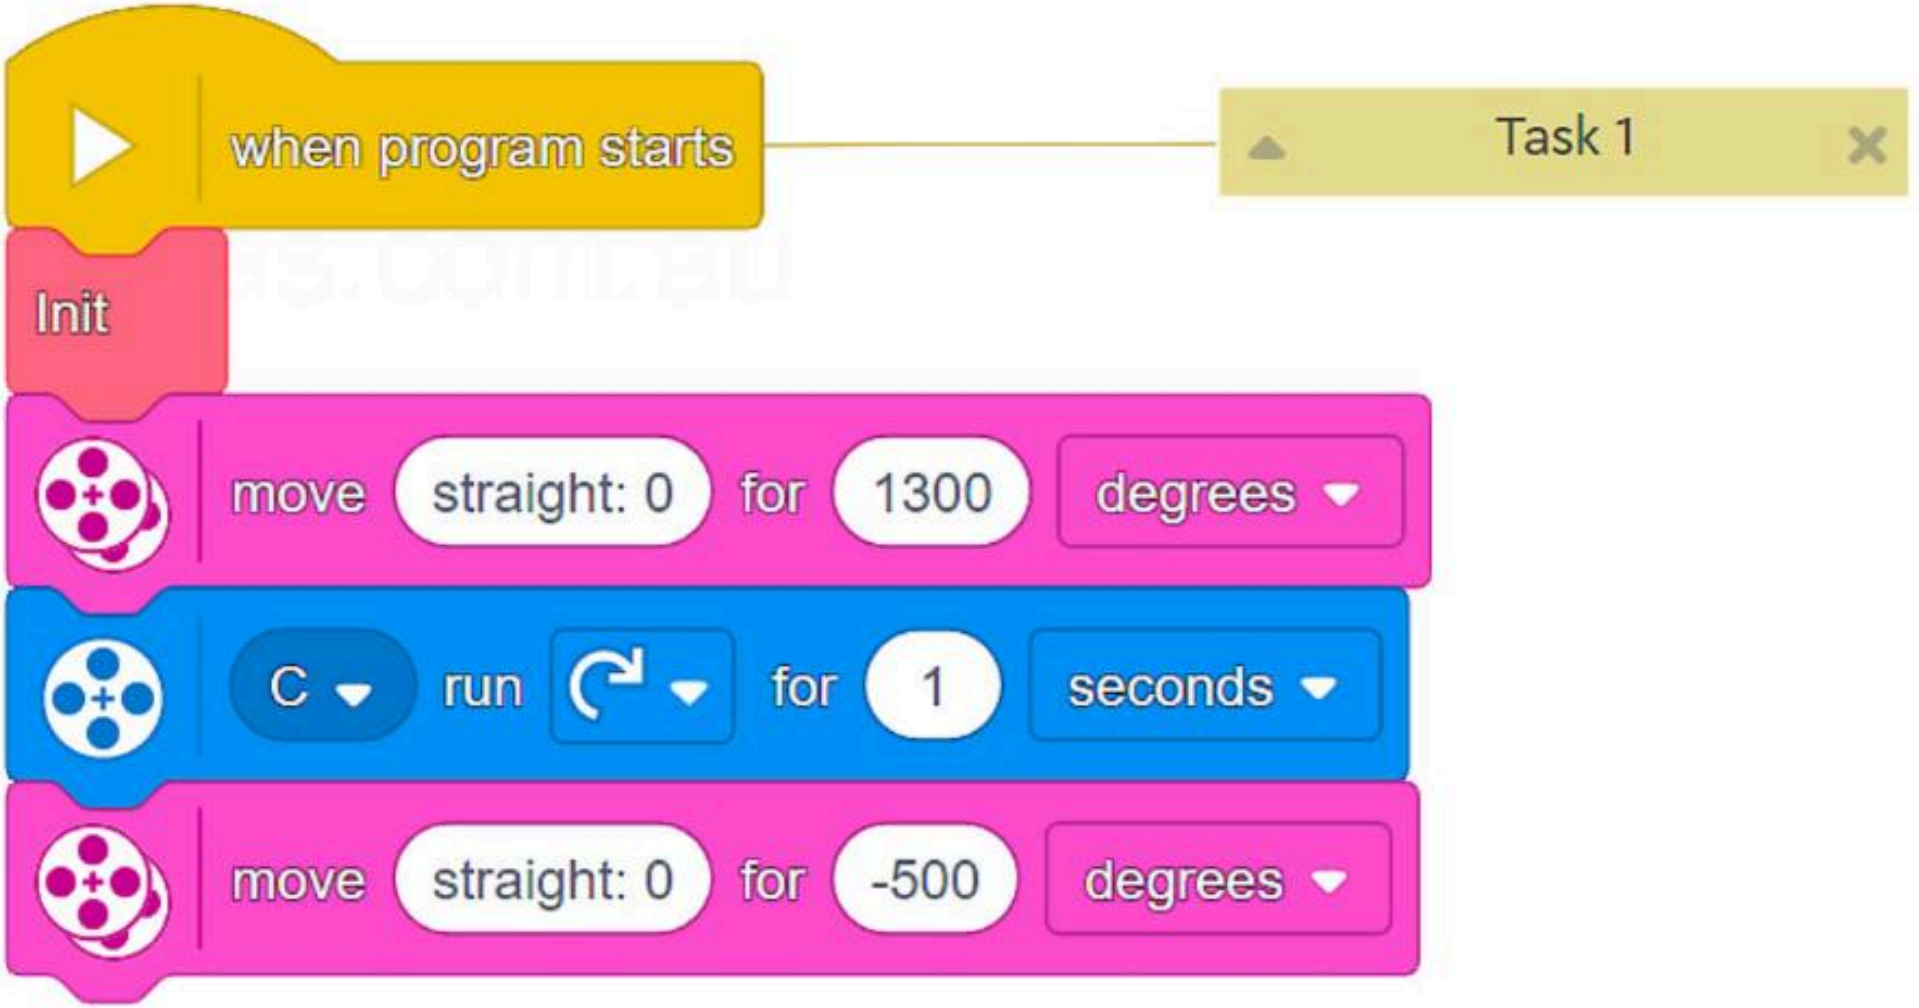

1
Adjust the motors for movement and wait for the start
2
Go forward to the stand with the object
3
Capture the object
4
Step back

define Init
C set speed to 50 %
A go shortest path to position 0
B go shortest path to position 0
C go shortest path to position 0
set movement motors to B+A
set movement speed to 50 %
wait until is left button pressed ?
wait 1 seconds

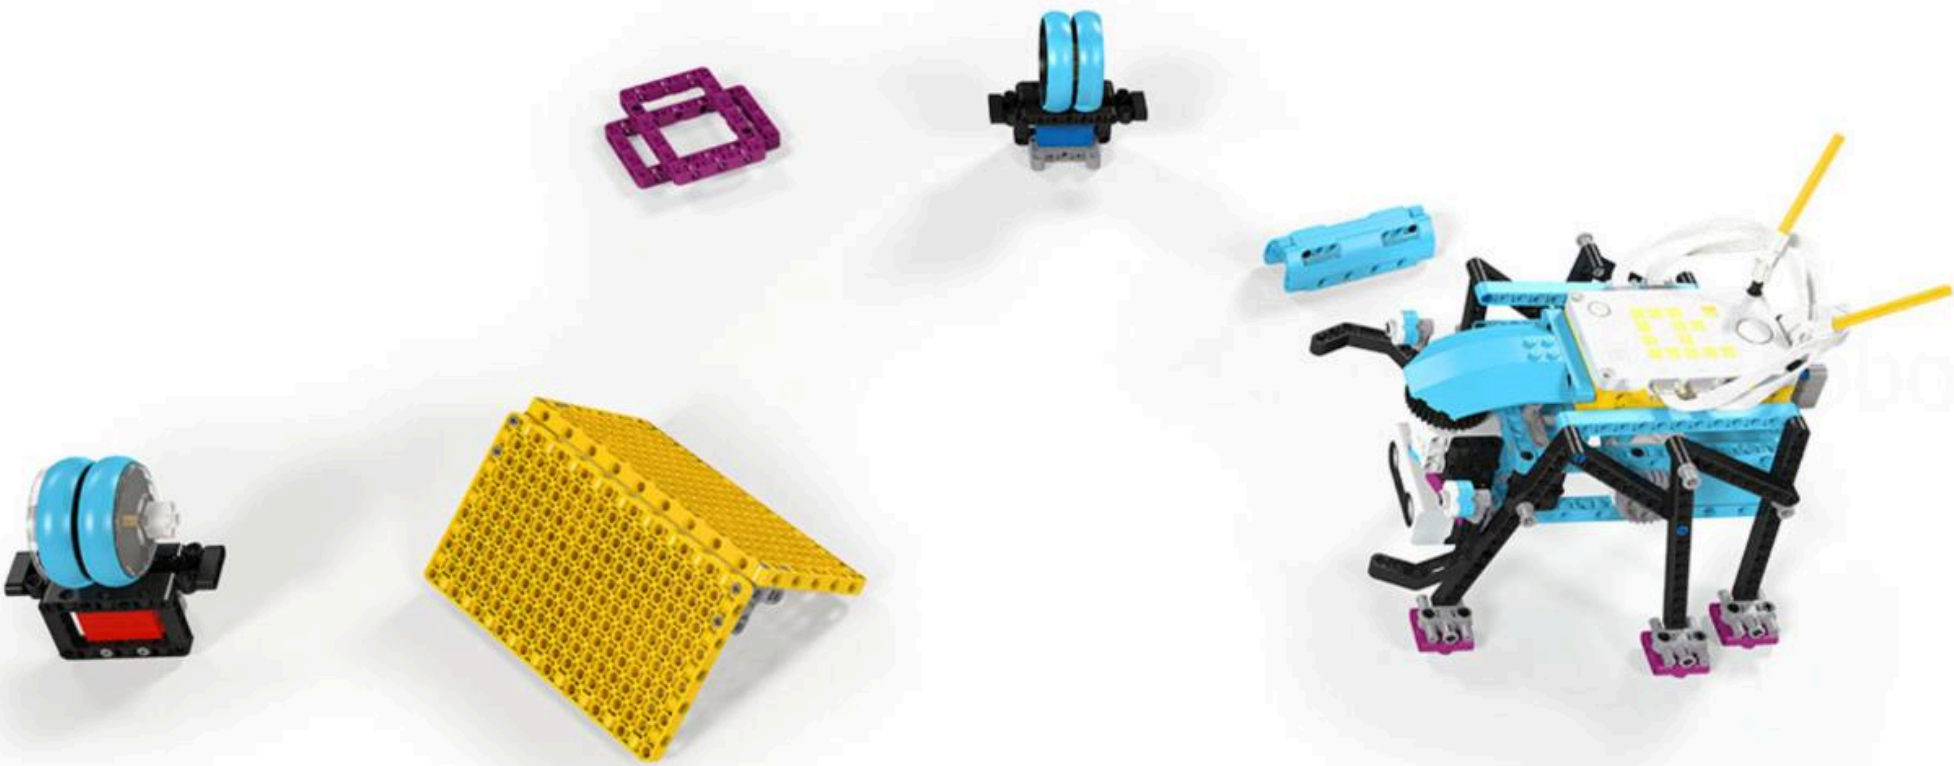

when program starts
Task 1
Init
move
straight: 0
for
1300
degrees
C
run
for
1
seconds
move
straight: 0
for
-500
degrees

Increase the distance to the object and repeat the test. You may encounter that the robot deviates from the intended course. This is due to the fact that the robot's legs have different grips on the surface and slide on it in different ways.

The block you wrote for moving in a straight line is convenient to use when the distance to be traveled is known and there are no external landmarks. However, the portal elements are on stands, which are easily detected by the distance sensor.
